NA	ME OF DEPTT/CENTR	RE:	Department of Civil Engineering				
1.	Subject code: CEN-102	2	Course	Title: S	olid	Mechanics	
2.	Contact Hours: L:	3	T: 1	P:	0		
3.	Examination Duration ()	Hrs):	Theory:	3		Practical:	0
4.	Relative Weightage: C	WS: 25	PRS: 0	MTE:	25	ETE: 50	PRE: 0
5.	Credits: 4	6. Se	emester: Spring		7.	Subject Area	a: ESC

- 8. Pre-requisite: Nil
- 9. Objective : To introduce the concepts of equilibrium and deformation in components, and structures for engineering design.
- 10. Details of Course :

S. No.	Contents	Contact Hours
1.	Analysis of Stresses and Strains : Concept of stress, normal	08
	stress and shear stress, nine Cartesian components of stress at a	
	point, sign convention and notation, equality of shear stresses	
	on mutually perpendicular planes and their planes of action,	
	stress circle; Concept of strain, normal and shear strain, two	
	dimensional state of strain, Poisson's ratio, volumetric strain,	
	strain circle, Concept of strain energy	
2.	Stress-Strain Relationships : Hooke's law and its application	02
	to isotropic materials, elastic constants and their relationships,	
	plane stress and plain strain conditions.	
3.	Mechanical Properties : Uniaxial tension test to determine	02
	yield and ultimate strength of materials, stress-strain diagram,	
	proof stress, ductile and brittle materials, hardness and impact	
	strength; Conditions affecting mechanical behaviour of	
	engineering materials	
4.	Members in Uniaxial State of Stress : Uniform cross-section	04
	and tapered bars subjected to uniaxial tension and	
	compression, composite bars and statically indeterminate bars,	
	thermal stresses; Introduction to plasticity; S.E. under axial	
	loading.	
5.	Members Subjected to Axi-Symmetric Loads : Stresses and	02
	strains in thin cylindrical shells and spheres under internal	
	pressure, stresses in thin rotating rings.	
6.	Members Subjected to Torsional Loads : Torsion of solid	02
	and hollow circular shafts, stepped and composting shafts,	
	close-coiled helical springs subjected to axial loads, S.E. in	

	torsion.	
7.	Members S ubjected t o Flexural L oads : Statically determinate beams, support reactions, relationship between load, shear force and bending moment, shear force and bending moment diagrams; Theory of flexure for initially straight beams, distribution of bending stresses across the beam cross-section, principal stresses in beams; Equation of elastic curve for the loaded beam, relationship between bending moment, slope and deflection; Calculation of deflection by integration, moment area and unit-load methods, S.E. in flexure.	15
8.	Members Subj ected t o Combined L oads : Short struts subjected to eccentric loads, shafts subjected to combined bending, torsion and axial thrust, concept of theory of failure.	02
9.	Elastic S tability of C olumns : Euler's theory of initially straight columns, critical loads for different end condition of columns, eccentric loading, columns with small initial curvature, empirical formulae.	02
10.	Stresses i n B eams (Advance T opics) : Composite beams, Transformed section method, Bending of unsymmetric beams, The shear-center concept.	03

5. Credits: 4	6. Sei	mester: Both	7.	Subject Area	: ESC

8. Pre-requisite: NIL

- 9. Objective: To introduce the students to the fundamentals of Electrical Engineering concepts of network analysis, principles of electrical machines, basics of electrical measurement and measuring instruments.
- 10. Details of Course:

S. No.	Contents	Contact Hours
1.	Energy Resources an d U tilization: Conventional and non-	5
	conventional energy resources; Introduction to electrical energy	
	generation from different resources, transmission, distribution and	
	utilization.	
2.	Network F undamentals: Types of Sources and elements,	5
	Kirchoff's Laws, Mesh and Node Analysis of D.C. Networks,	
	Network Theorems: Thevenin's Theorem, Norton's Theorem,	
	Superposition Theorem, Maximum Power Theorem, Star-Delta	
	Transformation.	
3.	A.C. F undamentals: Concept of phasor, impedance and	4
	admittance; Mesh and Node analysis of AC networks; Network	
	theorems in AC networks; Active and reactive power in AC circuits;	
	Resonance in series AC circuits; Power factor correction.	
4.	Three-phase A.C. Circuits: Analysis of 3-phase balanced start-	2
	delta circuits, Power in 3-phase Circuits.	
5.	Measurement of Electrical Quantities: Measurement of Voltage,	5
	Current, and Power; Measurement of 3 phase power; Energy meters.	
6.	Single P hase T ransformer: Introduction to magnetic circuit	5
	concepts, Basic constructional features, operating principle, phasor	
	diagram, equivalent circuit, voltage regulation; Eddy current and	
	Hysteresis losses, efficiency; Open circuit and Short Circuit tests.	

7.	D.C. Machines : Principle of operation, constructional features; Emf and torque equations; Types of excitation; Generator characteristics; Starting and speed control of D.C. motors.	5
8.	AC Machines : Three-phase Induction Motor - Operating principle, constructional features, torque-speed characteristics, starting and speed control; Single-phase Induction Motor - Operating principle, constructional features, torque-speed characteristics, starting methods.	5
9.	Industrial A pplications an d C ontrol: V arious industrial loads, traction, heating, lighting; Concept of power electronic control of AC and DC motors.	6

- 8. Pre-requisite: Nil
- 9. Objective: To introduce various numerical methods to get approximation solutions.
- 10. Details of Course:

S.No.	Contents	Contact Hours
1	Error A nalysis: Exact and approximate numbers, Rounding of	3
	numbers, Significant digits, Correct digits, various types of errors	
	encountered in computations, Propagation of errors.	
2	Solution of system of linear e quations: (i) Direct methods: Gauss	8
	elimination method without pivoting and with pivoting, LU-	
	decomposition method. (ii) Iterative methods: Jacobi and Gauss-Seidel	
	methods.	
3	Roots of n on-linear e quations: Bisection method, Regula-Falsi	6
	method, Newton-Raphson method, direct iterative method with	
	convergence criteria, Newton-Raphson method for solution of a pair of	
	non-linear equations.	
4	Eigen val ues an d Eigen vectors: Dominant and smallest Eigen	3
	values/Eigen vectors by power method.	
5	Interpolation: Finite difference operator and their relationships,	6
	difference tables, Newton, Bessel and Stirling's interpolation formulae,	
	Divided differences, Lagrange interpolation and Newton's divided	
	difference interpolation.	
6	Numerical d ifferentiation: First and second order derivatives by	4
	various interpolation formulae.	
7.	Numerical integration: Trapezoidal, Simpsons 1/3 rd and 3/8 rd rules	6
	with errors and their combinations, Gauss Legendre 2-points and 3-	
	points formulae	
8.	Solution of first and second order or dinary differential equations:	4
	Picard's method, Taylor's series method, Euler, Modified Euler, Runge-	
	Kutta methods and Milne's method.	
9.	Case studies	2

- 8. Pre-requisite: Nil

9. Objective: To introduce the concepts of procedural and object oriented programming in C++ and its application to problem solving.

S. No.	Contents	Contact Hours
1.	Introduction to Programming: Introduction to computer systems;	4
	Data representation; Basic idea of program execution at micro level;	
	Concept of flow chart and algorithms, algorithms to programs.	
2.	Basic Programming in C++: Constants, variables, expressions and	8
	operations; Naming conventions and styles; Conditions and selection	
	statements; Looping and control structures; File I/O; Header files,	
	string processing; Pre-processor directives such as #include, #define,	
	#ifdef, #ifndef; Compiling and linking.	
3.	Programming Through F unctional D ecomposition: Functions	10
	(void and value returning); Parameters passing by value, passing by	
	reference, passing by constant reference; Design of functions and	
	their interfaces (concept of functional decomposition), recursive	
	functions, function overloading and default arguments; Library	
	functions; Scope and lifetime of variables.	
4.	Data Structures: Fixed size data structures arrays and structures;	8
	Pointers and dynamic data, relationship between pointers and arrays,	
	function pointers, dynamic arrays; Introduction to dynamic data	
	structures linked lists, stacks, queues and binary trees.	
5.	Object Oriented Programming: Data hiding, abstract data types,	12
	classes, access control; Class implementation – default constructor,	
	constructors, copy constructor, destructor, operator overloading,	
	friend function; Object oriented design, inheritance and composition;	
	Dynamic binding and virtual functions; Polymorphism.

- 8. Pre requisite: Nil
- 9. Objectives of Course: To familiarize students with the principles of sheet metal forming, material removal and finishing operations.

S. No.	Particulars	Contact Hours
1	Introduction : Classification of different manufacturing processes,	2
	application areas and limitations, selection of a manufacturing process	
2	Sheet Metal Forming: Introduction to sheet metal forming operations,	10
	Types of presses, drives, Operations: shearing bending, spinning,	
	embossing, blanking, coining and deep drawing. Die materials,	
	compound and progressive dies and punches. Construction details of die	
	set. Auxiliary equipments, safety devices.	
3	Material Removal Processes: Classification of machining processes and	10
	machine tools. Tool's materials, different types of cutting tools,	
	Nomenclature of single point and multi point cutting tool. Concept of	
	cutting speed, feed and depth of cut. Coolants. Drilling, Boring and	
	broaching machines. Indexing head, milling operations using simple,	
	differential and compound indexing. Introduction to CNC Machines.	
4	Abrasive Finishing: Operations and applications of surface, cylindrical	6
	and centreless grinding processes; dressing, truing and balancing of	
	grinding wheels; grading and selection of grinding wheels.	
	Total	28

List of Experiments:

S. No.	Name of Experiment/Study
1.	Study of turret lathe
2.	Study of grinding machines, attachments and accessories
3.	External threading on a given job on lathe machine
4.	Internal threading on a given job on lathe machine
5.	Taper turning on a given job on lathe machine
6.	V-groove cutting on a gven job on lathe machine
7.	Profile turning on a given job on lathe machine
8.	Cutting teeth on a spur gear on milling machine
9.	Helical milling on a given circular job
10.	Slot cutting on a given job on milling machine
11.	Shaping operation on cast iron job
12.	Keyway cutting on a given job on slotting machine

1. Subject Code: MI	N-106	Course Title:	Engineering	Thermodynam	ics
2. Contact Hours:		L: 3	T: 1	P: 2/2	
3. Examination Durati	ion (Hrs.):	Theory: 3	Pra	ectical: 0	
4. Relative Weight:	CWS: 20	PRS: 20	MTE: 20	ETE: 40	PRE: 0
5. Credits: 4	6. Se	mester: Spring	7. Sub	ject Area: DCC	/ESC

8. Pre-requisite: Nil

9. Objective: To familiarize the students with basic concepts of macroscopic thermodynamics.

S. No.	Contents	Contact Hours
1.	Introduction: Introduction to thermodynamic system, surrounding,	3
	state, process, properties, equilibrium, heat and work, Zeroth Law of	
	Thermodynamics	
2.	Properties of Pure Simple Compressible Substance: PvT surface,	6
	Pv, Tv, TP diagrams. Equation of state for ideal and real gases.	
	Virial equation of state, van der Waal equation, use of steam tables	
	and Mollier diagram	
3.	First Law of Thermodynamics: First law application to non-flow processes such as isochoric, isobaric, isothermal, adiabatic and polytropic processes. Steady flow energy equation, flow work. Application to various practical systems viz. nozzles, diffuser, turbines, heat exchangers etc. Application of energy equation to transient flow problems.	7
4.	Second L aw of T hermodynamics: Second law, reversible and	6
	irreversible processes, Clausius and Kelvin Planck statements,	
	Carnot cycle, corollaries of second law: thermodynamic temperature	
	scale, Clausius inequality, entropy as a property, principle of	

	increase of entropy. Calculation of entropy change.	
5.	Entropy and E xergy: Entropy and its generation, entropy balance for closed system and for control volume, basic concepts of exergy and irreversibility, exergy for closed system and control volume, exegetic efficiency.	5
6.	Gas-Vapour M ixtures and A ir-conditioning: Properties of gas- vapour mixtures, adiabatic-saturation and wet-bulb temperatures, psychrometric chart, human comfort and air conditioning, various air conditioning processes.	4
7.	Gas and Vapour Power Cycles: Otto, Diesel, Dual, Stirling, Joule- Brayton cycle. Thermal efficiency and mean effective pressure, Rankine cycle.	5
8.	Refrigeration C ycles: reverse Carnot cycle, vapour compression refrigeration cycle.	4
	TOTAL	42

List of Experiments:

- 1. Study of P-V-T surface of H₂O and CO₂.
- 2. Determine P-T relationship for steam and verify Clausius Clapeyron equation.
- 3. Determine the calorific value of coal using Bomb calorimeter.
- 4. Analysing exhaust gases using Orsat apparatus.
- 5. Determine Relative Humidity and Specific Humidity of air using Sling Psychrometer and Psychrometric Chart.
- 6. Determine COP of a vapour compression refrigeration unit.
- 7. Analysing different processes on an air conditioning unit.

5. Credits: 4	6. S	emester: Spring	7. Sub	ject Area: DCC
8. Pre-requisite:	Nil			

9. Objective: To provide the basic knowledge of fluid statics and dynamics.

S. No.	Contents	Contact Hours
1.	Introduction : Continuum concept, properties of fluids, Newtonian and Non-Newtonian fluids.	3
2.	Fluid S tatics: Pascal's law, hydrostatic pressure, pressure measurement, manometer and micro-manometer, pressure gauge; Forces on plane and curved surfaces, centre of pressure, equilibrium of submerged and floating bodies, buoyancy, metacentric height; Fluids subjected to constant linear acceleration and to constant rotation.	5
3.	Kinematics of F luid: Types of flow, Lagrangian and Eulerian approach, path line, streak line and stream line, stream tube, stream function and potential function, flownet; Deformation of fluid elements, vorticity and circulation.	4
4.	Fluid D ynamics: Reynolds transport theorem; Conservation equations of mass, momentum and energy, Navier-Stokes, Euler and Bernoulli equations; Forces due to fluid flow over flat plates, curved vanes and in the bends, applications of Bernoulli equation.	8
5.	Ideal F luid F low: Ideal flow identities, flow over half body, Rankine oval, stationary and rotating cylinders, Magnus effect, d'Alembert's paradox.	5
6.	Viscous F low: Reynolds experiment, laminar and turbulent flow, plane Poiseuille flow, Couette flow, Hagen-Poiseuille flow; Friction factor and Moody's diagram, losses in pipes and pipe fittings; Flow over aerofoil, lift and drag, flow separation.	6
7.	Dimensional A nalysis: Basic and derived quantities, similitude and dimensional analysis, Buckingham π – theorem, non-dimensional parameters, model testing.	4

8.	Flow Measurement: Flow measuring devices, Pitot tube, obstruction	3
	flow meters, principles of hot anemometry and particle image	
	velocimetry.	
9.	Compressible F low: Propagation of sound waves, Mach number,	4
	isentropic flow and stagnation properties, one dimensional	
	convergent-divergent nozzle flow, normal shock.	
	Total	42

LIST OF EXPERIMENTS

S. No.	Name of Experiment
1.	Experimental verification of Bernoulli's theorem
2.	Impact of jet of a fluid on vanes
3.	Calibration and determination of coefficient of discharge for
	(1)Venturimter and (2) Orificemeter
4.	Calibrate V and rectangular notch (or weir) and compare their performances
5.	Flow visualization/patterns
6.	Flow field investigation by using educational PIV setup

8.Subject Area: DCC

9.Objectives of Course: This course is intended to impart fundamentals of the theory of various manufacturing processes used in industry and fundamentals of tooling design and metrology.

S. No.	Particulars	Contact Hours
1	Theory of Metal Cutting: Tool geometry, chip formation, chip control, mechanics of single point orthogonal machining, tool life, economics of metal cutting.	08
2	Non-Conventional Machining Methods: Comparison with conventional methods, principles and applications of ECM, EDM, ultrasonic, electron beam and laser machining.	05
3	Jigs and Fixtures: Usefulness of Jigs and Fixtures, Design principles of jigs and fixtures, Principles of location and clamping,Types locating and clamping devices, Few simple design of Jigs and Fixtures : lathe, milling, boring, shaping, broaching, grinding, assembly and welding fixtures, Economics of Jigs and Fixtures.	06
4	Metrology: Introduction, inspection types and principles, radius and taper measurement, measurement of screw threads and gears. Limits, fits, and dimensional and geometrical or form tolerances, computer vision system based measurement, coordinate measuring machines, measurement of form tolerances, measurement of surface roughness: surface roughness terminology, different methods of surface roughness measurement.	06
5	Foundry: Gating system design, Risering design, production of gray, malleable and spheroidal graphite iron castings.	06
6	Welding: Weldability, structure in weld and heat affected zones, distortion and residual stresses, welding of cast iron, stainless steel and aluminum, hard facing.	05

7	Forming : Introduction of forming process analysis methods (slab method, uniform deformation energy method, limit analysis), Analysis of extrusion, rolling and forging processes, forming defects, formability & workability, temperature & lubrication aspects in forming.	06

9. Objective: The course is designed to familiarize the students with fundamentals of thermodynamics and heat transfer.

MTE: 20

ETE: 40

PRE: 0

S. No.	Contents	Contact Hours
1.	Introduction: Introduction to Thermodynamics, examples of thermal power plants, refrigeration systems; Definitions: system, boundary, surroundings, closed and open systems, properties, processes, work and heat interactions.	2
2.	Laws of t hermodynamics: Zeroth law, concept of temperature, temperature scales, methods of temperature measurement; First law for cyclic process in closed system, internal energy; First law for open system, steady flow energy equation (SFEE), application of SFEE for simple devices.	8
3.	Properties of pure substance: Properties of pure substance, T - v , p - v diagrams, properties of steam, use of steam tables, example problems for use of steam tables.	6
4.	Second I aw of t hermodynamics: Kelvin-Planck and Clausius statements of second law of thermodynamics, Carnot theorem, corollaries of Carnot theorem for absolute temperature scale, entropy.	6
5.	Power C ycles: Rankine vapor power cycles on T-s diagrams, gas power cycles, Otto, Diesel and Joule cycles, simple problems.	6
6.	Refrigeration & A ir-conditioning: Working of simple vapor compression cycle, representation of various processes on p-h diagram, air-conditioning principles, definitions of humidity, relative humidity, wet-bulb and dry-bulb temperatures. Psychrometric chart, representation of various air-conditioning processes on	6

	psychrometric chart.	
7.	Heat Transfer: Introduction to different modes of heat transfer,	
	conduction, convection and radiation.	
	Conduction: Fourier's law of heat conduction, 1D heat conduction	
	equation, different types of boundary conductions, thermal resistance,	
	composite wall for plane wall and cylindrical geometries.	8
	Convection: Free and forced convection principles, important non-	
	dimensional numbers, correlations for Nusselt number.	
	Radiation: Basic laws of radiation, black body concept, emissivity,	
	absorptivity, reflectivity, transmissivity.

9. **Objectives of C ourse:** This course is intended to impart fundamentals of the theory of machining, advanced machining, finishing processes besides tooling design and metrology.

S. No.	Contents	Contact Hours
1.	Theory of Mac hining: S ingle point and multi-point machining, chip formation: mechanism, chip types, chip control, tool geometry: single point, specifications in different systems, selection of tool angles, orthogonal and oblique machining, cutting tool geometry, mechanics of single point orthogonal machining: Merchant's circle, force, velocity, shear angle, and power consumption relations, cutting tool wear and tool life: wear mechanisms, wear criterion, Taylor's tool life equation, facing test, variables affecting tool life; Machinability and its measures, economics of machining.	11
2.	Advanced Man ufacturing Processes: Process principle, equipment, analysis and applications of advanced machining processes such as Abrasive Jet Machining, Ultrasonic Machining, Water Jet Machining, Electro Chemical Machining, Chemical Machining, Electro-Discharge Machining, Wire Electro Discharge Machining, Electron Beam Machining, and Laser Beam Machining, rapid prototyping and rapid tooling: introduction of solid-based (FDM, LOM), liquid-based (SLA, SGC), powder-based (3DP, BPM) RP processes.	11
3.	Finishing and Superfinishing Processes: Principles and applications of honing, superfinishing, lapping, polishing, buffing, peening, and burnishing	4
4.	Metrology: Introduction, inspection types and principles, radius and taper measurement, measurement of screw threads and gears. Limits, fits, and dimensional and geometrical or form tolerances, computer vision system based measurement, coordinate measuring machines, measurement of form tolerances, measurement of surface roughness: surface roughness terminology, different methods of surface roughness measurement	9
5.	Jigs and Fixtures: Usefulness of Jigs and Fixtures, Design principles of jigs and fixtures, Principles of location and clamping, Types locating and clamping devices, Few simple design of Jigs and Fixtures : lathe, milling, boring, shaping, broaching, grinding, assembly and welding fixtures, Economics of Jigs and Fixtures	7

8. Pre-requisite: Nil

9. Objectives of Course: The course has been designed to impart basic understanding of heat and mass transfer mechanisms and to enable the students to apply these in solving real problems.

S. No.	Particulars	Contact Hours
1	Introduction: Mode of heat transfer, conduction, convection and	02
	radiation.	
2	Conduction: Fourier, s, law, thermal conductivity of matter and other relevant properties, heat diffusion equation, boundary and initial conditions. One –dimensional steady- state conduction through plane wall, cylinder and sphere, conduction with thermal energy generation, heat transfer from extended surfaces. Two- dimensional steady-state	12
	conduction through plane wall.	
3	Convection: Velocity, thermal and concentration boundary layers and their significance, laminar and turbulent flow, convection transfer equations, boundary layer similarity and normalized convection transfer equations, heat and mass transfer analogy, Reynolds analogy, effect of turbulence, convection in external and internal flow, free convection, boiling and condensation.	08
4	Heat ex changers: Heat exchangers types, overall heat transfer coefficient, analysis of parallel-flow, counter flow, multipass and cross-flow heat exchangers, effectiveness – NTU method, compact heat exchangers.	05
5	Radiation: Fundamental concepts, radiation intensity and its relation to	10

	emission, irradiation and radiosity, blackbody radiation, Planck	
	emission, surface absorption, reflection, and transmission, kirchhoff's	
	law, gray surface. Radiation exchange between surfaces, view factor,	
	blackbody radiation exchange, radiation exchange between diffuse gray	
	surfaces in an enclosure.	
6	Diffusion Mas s T ransfer: Fick's law of diffusion, mass diffusion	05
	equation, boundary and initial conditions, mass diffusion without and	
	with homogeneous chemical reactions, transient diffusion.

9. O bjectives of Course: This course is intended to impart fundamentals of the theory of casting, welding and forming processes and powder metallurgy.

S. No.	Contents	Contact Hours
1.	Theory of Casting: Cooling and solidification of castings, cooling curves, nucleation and dendrite formation, , design of gating and risering system in ferrous and nonferrous foundry practice, production of gray, malleable, and spheroidal graphite iron castings, mechanization in foundry equipments.	12
2.	Theory of Welding: Thermal effects in welding, structure in weld and heat affected zones, distortion and residual stresses, weldability, weld quality, welding of cast iron, stainless steel and aluminum, hard facing, brazing, soldering, and adhesive bonding.	10
3.	Theory of Forming: Mechanics of materials: elastic and plastic behavior, concept of stress and strain and their types, Mohr's stress and strain circle in 2-D and 3-D, stress and strain tensor, hydrostatic and deviatoric components, elastic stress-strain relations, strain energy, anisotropy of elastic behavior; Theory of Plasticity: true stress and strain, flow curve, concept of anelastic, hysteresis, and visco-elastic behavior, Bauschinger effect, Tresca and Von-Mises yield criteria, anisotropy in yielding, octahedral normal and shear stresses and strains, invariants of stress and strains, flow rules or plastic stress-strain relations.	10
4.	Analysis of Forming Processes: Slab method, uniform deformation energy method, limit analysis, analysis of drawing, extrusion, rolling, forging, deep drawing, and bending, forming defects, formability & workability, temperature & lubrication aspects in forming.	6

5.	Powder Metallurgy: Theory of powder metallurgy, manufacture of metal powders, sintering, secondary operations, properties of finished parts, design considerations and applications.	4

9. Objective: To teach students various tools and techniques used for the performance analysis of manufacturing systems.

S. No.	Contents	Contact Hours
1.	Introduction: Definitions of manufacturing with input-output	4
	model, Definition of system, Basic problems concerning systems and	
	system design procedure, Modes of manufacturing - job/batch/flow	
	and multi-product, small-batch manufacturing.	
2.	System M odeling Issues: Centralized versus distributed control;	8
	Real-time vs. discrete event control; Forward vs. backward	
	scheduling approaches with finite/infinite capacity loading;	
	Modeling of absorbing states and deadlocks, conflicts, concurrency,	
	and synchronization etc.	
3.	System M odeling Tools an d Techniques: Introduction to	15
	mathematical modeling, optimization, and simulation; issues related	
	with Deterministic and Stochastic models, continuous and discrete	
	mathematical modeling methods-Discrete event, Monte Carlo method. Desig Concerts of Markov Chains and Processes. The	
	method; Basic Concepts of Markov Chains and Processes; The $M/M/I$ and $M/M/m$ Quarkov Models of manufacturing systems	
	including transfer lines and flexible manufacturing systems	
	Introduction to Petri nets	
4	Performance A nalvsis: Transient analysis of manufacturing	15
	systems. Analysis of a flexible machining center: Product flow	15
	analysis: Rank order clustering: Process flow charting: MRPI& II.	
	Kanban, OPT, JIT-Pull and JIT-Push, Line of balance, Effects of	
	machine failure, set-ups, and other disruptions on system	
	performance; Calculation of performance measures-throughput, in-	
	process inventory, due dates, MTL, Capacity, and Machine	
	utilization etc.; Critique of high inventory, long lead time systems;	
	Shop floor control issues.

- 9. Objective: To provide knowledge and details of the means of computer aided manufacturing and various functions supporting the automated manufacturing.
- 10. Details of Course:

S.	Contents	Contact
1	Introduction: Introduction to manufacturing systems and their performance analysis; Introduction to automation; Introduction to computer integrated manufacturing (CIM).	04
2	Numerical Control (NC): Introduction, numerical control – its growth and development, components of NC system, input devices, control systems – point to point, straight cut, and continuous path NC, open loop and closed loop NC systems, NC interpolations – linear, circular, helical, parabolic and cubic interpolation, applications of NC systems, merits and demerits.	10
3	Extensions of N C: Concepts of computer numerical control (CNC), machining center, and direct numerical control (DNC), and their advantages.	06
4	Robotics: Robot anatomy and related attributes, robot control systems – limited sequence, playback with point to point, playback with continuous and intelligent control; End effectors – gripper, tools; Sensors in robotics – tactile sensors, proximity, optical sensors and machine vision; Applications of industrial robots, robot programming.	06
5	Material H andling a nd S torage: Overview of material handling equipments, automated material handling equipments – AGVs, conveyor systems, performance analysis of material handling systems, automated material storage systems – ASRS and carousel storage, analysis of automated storage systems.	06
6	Manufacturing Support Functions: Introduction to group technology (GT), computer aided process planning (CAPP), material requirement planning (MRP), capacity planning, scheduling etc.	10

NA	AME OF DEPTT./CENTRE:	Mechanical & Ind	lustrial Engineering
1.	Subject Code: MIN-332	Course Title: Industrial	Hazards and Safety
2.	Contact Hours :	L: 3 T: 0	P: 0
3.	Examination Duration (Hrs.): Theory: 3 Practic	cal: 0
4.	Relative Weight : CWS: 25	PRS: 0 MTE: 25	ETE: 50 PRE:0
5.	Credits: 4	6. Semester: Both	7. Subject Area: DEC/DHC

8. Pre – requisite: Nil

9. Objectives of Course:

The course is planned in such a manner that the students can build on the foundation laid in the basic course on Industrial Hazards and Safety. The course will highlight in detail various Industrial Hazards with emphasis on different types of safety measures.

S.No	Particulars	Contact Hours
1	PHVSICAL HAZARDS	110015
	Noise, properties of sound, occupational damage, risk factors, sound measuring instruments, noise control programmes. Ionizing radiation, types, effects, monitoring instruments, control programmes, OSHA standard - non-ionizing radiations, effects, types, radar hazards, microwaves and radio-waves, lasers, TLV- cold environments, hypothermia, wind chill index, control measures- hot environments, thermal comfort, heat stress indices, acclimatization, estimation and control.	9
2	CHEMICAL AND NUCLEAR HAZARDS	
2	Recognition of chemical hazards- types, and concentration, Exposure vs. dose, TLV - Methods of evaluation, process or operation description, field survey, sampling methodology, Air Sampling instruments, Types, Measurement Procedures, Instruments Procedures, Gas and Vapour monitors, dust sample collection devices, personal sampling. Methods of Control - Engineering Control, Nuclear hazards, Disposal of nuclear wastes, Safety measures In nuclear plants	9
3	BIOLOGICAL AND ERGONOMICAL HAZARDS	
	Classification of Biohazardous agents – examples, bacterial agents, rickettsial and chlamydial agents, viral agents, fungal, parasitic agents, infectious diseases - Biohazard control Programmes, employee health Programmes- laboratory safety programmes-animal care and handling-biological safety cabinets – building design. Work Related Musculoskeletal Disorders – careal	9

	tunnel syndrome (CTS) - Tendon pain-disorders of the neck- back injuries.	
4	OCCUPATIONAL HEALTH AND TOXICOLOGY Concept and spectrum of health - functional units and activities of occupational health services, pre - employment and post-employment medical examinations - occupational related diseases, levels of prevention of diseases, notifiable occupational diseases, their effects and prevention. Industrial toxicology, local, systemic and chronic effects, temporary and cumulative effects, carcinogens entry into human systems.	8
5	OCCUPATIONAL PHYSIOLOGY Man as a system component – allocation of functions – efficiency – occupational work capacity – aerobic and anaerobic work – evaluation of physiological requirements of jobs – parameters of measurements – categorization of job heaviness – work organization – stress – strain – fatigue – rest pauses – shift work – personal hygiene.	7

8. Pre-requisite: Nil

9. Objectives of Course: The course is designed to give the undergraduate students the basic knowledge about the measurement systems and its components. Further, the various other issues related to above aspects have been discussed.

S. No.	Particulars	Contact Hours
1	Generalized C onfiguration of Meas uring System : Functional elements of a basic measuring system; different types of measurands, description of functional elements. Input-output configuration of a measuring system. Interfering and modifying inputs; methods for correction for interfering and modifying inputs.	06
2	Characteristics of Instruments : Objective of studying the characteristics of the instruments. Static characteristics – accuracy, precision, error, sensitivity, hysterisis, threshold, drift, span, static stiffness etc. Dynamic Characteristics – time domain and frequency domain characteristics terms. Input-output Impedance's and meaning of impedance mismatching. Concept of mechanical loading.	04
3	Measurement System Behaviour : Description of mathematical model for the generalized configuration of a measurement system. Response characteristics of the system – Amplitude, frequency and phase response. Order of the systems, response of zero, first and second order systems to step, ramp and sinusoidal inputs. Transfer function method to study the response of the system.	07
4	Uncertainty Analysis : Classification of errors systematic errors, random errors, illegitimate errors and statistical analysis of experimental data, computation of maximum and rss error .	03

5	Principles of Transduction and Transducers : Description of various types of transduction principles. Transducers based on variable resistance, variable inductance, variable capacitance and piezo-electric effects. Displacement transducers - wire wound potentiometers, LVDT, strain gages, strain gage designation system. Diaphragm type Pressure Transducers and other pressure measuring techniques. Design of accelerometers and their applications. Temperature and flow measurement techniques, ultrasonic measurements. Signal conditioners - filters, low, high, band pass and charge amplifiers.	18
6	DAS an d S ignal A nalysis : Data acquisition system via computers. The components of Data acquisition system, DAS Hardware, selection criteria for choosing a DAS. Techniques for signal analysis.	04

8. Pre-requisite: Graduate level course on Heat and Mass Transfer and Fluid Mechanics.

- 9. Objective: The course has been designed to make the students capable to select and design various types of heat exchangers used in industries.
- 10. Details of Course:

S.	Particulars	Contact
No.		Hours
1	Introduction: Heat exchanger types and construction, heat transfer and fluid	6
	flow fundamentals.	
2	Types of heat exchangers: Derivations for counter flow and parallel flow heat	6
	exchangers, LMTD and ε -NTU method, double pipe heat exchangers, crossflow	
	heat exchangers, shell-and-tube heat exchangers, TEMA standards.	
3	Design S trategy: General design considerations and approaches, design	8
	strategies, material selection and fabrication processes, cost estimation, optimum	
	design.	
4	Design of Single Phase H eat E xchangers: Liquid to liquid, gas to gas and	6
	liquid to gas heat exchangers.	
5	Design of T wo P hase H eat E xchangers: Steam generators,	6
	condensers, principle of cooling towers.	
6	Design of C ompact H eat E xchangers: Definition, types, design parameters,	8
	design calculations for liquid-air heat exchangers.	
7	Introduction to micro, nano and PCB type heat exchangers, familiarization with	2
	heat exchanger design softwares, computer aided design.

^{9.} Objective: To introduce the basic principles of refrigeration and air conditioning processes and relevant equipment associated with the process. Load calculation in an air-conditioning system.

S. No.	Contents	Contact Hours
1	Introduction: Review of basics thermodynamics and history of refrigeration and air-conditioning	1
2	Air cycle refrigeration :Carnot Cycle; Bell Coleman Cycle; Aircraft	4
	Refrigeration: Simple Cycle, Boor Strap cycle, Regenerative Cycle,	-
	Reduced Ambient cycle, DART.	
3	Refrigerants: Important refrigerants and their properties; leak	2
	detection; charging of refrigerants, selection of refrigerant	-
	compressors. CFCs and Ozone Hole; Ozone-safe Refrigerants, Global	
	Warming and refrigerants.	
4	Vapour Compression Cycle : Carnot vapor compression Cycle; T-s	7
	and P-h diagrams of vapour compression refrigeration cycle;	
	Departure of actual vapor compression cycle from theoretical cycle.	
	Compressor volumetric efficiency. Analysis of actual cycle, second	
	law analysis of vapour compression cycle. Effect of suction and	
	discharge pressure, subcooling and superheating on performance.	
	Compound vapour compression system with intercooling for single	
-	and multiple evaporator. Cascading.	
5	Vapour A bsorption R efrigeration S ystems : Aqua-ammonia	3
	absorption refrigeration system; Lithium bromide-water absorption	
	systems; properties of aqua-ammonia solution, p-t-x chart; enthalpy	
	concentration chart. Three fluid Electrolux system.	
6	Water Retrigeration : Introduction; Principle of Operation; Steam Jet	2
	Retrigeration; Centrifugal Retrigeration; Merits and Demerits of	
_	steam jet retrigeration; Characteristics of Steam Jet Refrigeration	
7	Non-conventional R efrigeration S ystems : Vortex and Pulse Tube	2
	Retrigeration Systems; Thermoelectric Retrigeration Systems	

8	Psychrometrics : Introduction to Air conditioning; Psychrometric processes: evaporative cooling, humindifier efficiency; cooling and dehumidification by chilled water spray and cooling coils; bypass factor; chemical dehumidification; sensible heat factor; apparatus dew point. Elements of comfort air conditioning.	6
9	Infiltration an d V entilation : Basic concepts ant terminology; Driving mechanism of infiltration and ventilation; Indoor air quality; natural ventilation; Residential air leakage; Residential ventilation; Residential ventilation requirements.	4
10	Cooling L oad C alculations : Introduction; Health and comfort criterion; Thermal Comfort; Design conditions; Estimation of heat loss and heat gain in a building: HB and RLF method.	8
11	Space A ir D istribution : Room air distribution; total, static and velocity pressures; friction loss in ducts; dynamic loss in ducts; air duct design: equal friction method, static regain method, velocity reduction method.	3

8. Subject Area: DEC

9. Objectives of Course:

Objective of the course is to expose students about the pollution caused by the thermal power plants, automobiles and transport systems; and possible control measures to reduce the environmental pollution.

10. Details of Course:

S.	Particulars	Contact
No.		Hours
1	Introduction : Nature and extent of pollution problem, types of pollution.	2
2	Air Pollutants : Air pollutants, oxides of nitrogen, sulphur oxides, particulate	
	matter, oraganic compounds, carbon monoxide; their harmful effects.	4
3	Air Pollution S ources: Stationary sources, emission from stacks, mobile	6
	sources, pollutant formation in SI and CI engines and gas turbines.	
4	Air Pollution Control: Stack emission control, inertial devices, electro-static	
	propitiators, particulate scrubbers, dry and wet methods, filters. IC Engine	10
	pollution control devices, thermal reactors, catalytic converters, particulate traps.	
5	Thermal Pollution : Nature of thermal pollution; effect of thermal pollution on	
	ecology, thermal plume, regions of plume, parameters relevant to thermal plume	10
	and their limit. Mechanics of condenser water discharge from thermal power	
	plants.	
6	Global Atmospheric Changes: Green house effect, green house gases,	
	Ozone depletion and control.	8

8. Subject Area: DEC

- 9. Objectives of Course: To explain the working methodology of different power plants being used for generation of electrical energy.
- **10.** Details of Course:

S. No.	Particulars	Contact Hours
1.	Introduction: Energy sources for generation of electric power, energy policy	4
	of India, present status and future trends, major power plants in India.	
2.	Thermal Power Plants: Selection of site, general layout of the plant, major	8
	components- Boilers, Economisers, Super-heaters, Air pre-heaters, fuels,	
	fuel and ash handling equipment's, High pressure Boilers, steam turbines,	
	station heat balance and plant efficiency.	
3.	Diesel Power Plant: Diesel engine, engine performance and operation, super	4
	charging, Diesel Electric power plant layout.	
4.	Gas Turbine Power Plants: Gas turbine power plants, basic cycles, cycle	4
	calculation, the ideal and real operating cycles, components and layout.	
5.	Hydro Power Plants: Classification of hydro-plants, selection of site, rain	6
	fall and run off, calculation of storage capacity, plant layout, estimation of	
	power available, selection of hydraulic turbines and their governing.	
6.	Nuclear Power Plants: Introduction, Atomic structure and radio-activities	6
	nuclear reactions, binding energy, Nuclear Reactors, Types of reactors,	
	Pressurized water reactors, boiling heater reactors, Heavy water-cooled and	
	moderated (CANDU) reactor, Gas-cooled reactors, Liquid metal cooled	
	reactors, Indian Nuclear power installations, comparison between Nuclear and	
	Thermal plants.	
7.	Non-Conventional Power Plants: Geothermal power plants, Tidal power	4
	plants, Wind power plants, solar power plants, M.H.D. Generators, OTEC	

8.	Power Plant E conomics & en vironmental as pect: Plant investment costs,	6
	fixed charges, Operation cost, energy cost, depreciation and operating costs	
	on the selection of equipments, incremental cost, comparison of fixed and	
	operating costs, greenhouse effect, thermal pollution, other pollutants.

-

9. Objective: The course deals with the principles underlying the industrial combustion equipment.

S. No.	Contents	Contact Hours
1.	Introduction: Industrial Combustion, requirements and applications	
		2
2.	Combustion Fundamentals :	
	i Thermodynamics of Combustion:	
	Combustion Stoichiometry, evaluating enthalpy of reacting systems,	
	enthalpy of formation, energy balance for reacting systems, enthalpy	
	of reaction and heating values. Adiabatic flame temperature.	
	Equilibrium criteria, chemical potential, equation of reaction	
	equilibrium, equilibrium constant, equilibrium composition and flame	6
	temperature.	
	ii Chemistry of Combustion	
	Rate laws and reaction orders, elementary reactions, reaction	
	Molecularity, temperature and pressure dependence of reaction rate,	
	Arrhenius law, chain reactions, and reaction mechanisms. Combustion	
	characteristics of hydrocarbons. NO_x formation and its control.	7
	iii Flame Processes:	
	Different types of flames, laminar flame structure, laminar flame	
	speed, effect of various chemical and physical parameters on flame	
	speed, Flammability Limits, Stability Limits.	
	Turbulent Premixed Flames: Applications, Turbulent Flame Speed,	
	Structure of Turbulent Flames, Flame Stabilization, Turbulent	

	Nonpremixed Flames.	7
3.	Gas Fired Furnaces & Boilers Gas fired furnaces, Energy Balance and Efficiency, Fuel Substitution, Gas burners, Classifications, Design factors, Heat Transfer From Burners	7
4.	Oil fired Furnaces & Combustion Systems Spray formation and droplet behavior, droplet size distribution, Fuel Injectors, Oil fired systems, Spray combustion in furnaces and boilers. Emissions from oil fired furnaces and boilers	6
5.	Coal Fired Combustion Systems : Combustion mechanism of solid fuels, Grate burning systems, traveling vibrating grate spreader stokers, pulverized coal burning systems, Fluidized bed combustion, atmospheric pressure fluidized bed combustion systems, circulating and pressurized fluidized bed systems. Emissions from grate burning systems, pulverized coal and fluidized bed combustion boilers.	7

8.	Pre-requisite: Nil					

9. Objectives of Course: The course is designed to give the undergraduate students the basic knowledge about the measurement systems and its components. Further, the various other issues related to above aspects have been discussed.

S.	Particulars	Contact
No.		Hours
1	Generalized Configuration of Measuring System : Functional elements of a	06
	basic measuring system; different types of measurands, description of functional	00
	elements. Input-output configuration of a measuring system. Interfering and	
	modifying inputs; methods for correction for interfering and modifying inputs.	
2	Characteristics of Instruments : Objective of studying the characteristics of the	04
	instruments. Static characteristics - accuracy, precision, error, sensitivity,	04
	hysterisis, threshold, drift, span, static stiffness etc. Dynamic Characteristics –	
	time domain and frequency domain characteristics terms. Input-output	
	Impedance's and meaning of impedance mismatching. Concept of mechanical	
	loading.	
3	Measurement System Behaviour : Description of mathematical model for the	07
	generalized configuration of a measurement system. Response characteristics of	07
	the system – Amplitude, frequency and phase response. Order of the systems,	
	response of zero, first and second order systems to step, ramp and sinusoidal	
	inputs. Transfer function method to study the response of the system.	

4	Uncertainty Analysis : Classification of errors systematic errors, random	03
	errors, inegitimate errors and statistical analysis of experimental data,	
_		
5	Principles of Transduction and Transducers : Description of various types	08
	of transduction principles. Transducers based on variable resistance, variable	00
	inductance, variable capacitance and piezo-electric effects. Displacement	
	transducers - wire wound potentiometers, LVDT, strain gages, strain gage	
	designation system. Diaphragm type Pressure Transducers and other pressure	
	measuring techniques	
6	Flow Mass urament: Flow visualization shadowgraph: schligrap and	06
U	Flow Meas urement. Flow Visualization, shadowgraph, semicient and	VU
	interferometric techniques; Pitot static tubes; hot wire anemometers; Laser	
	Doppler velometer; flow measurements using coriolis effect.	
7	Temperature and H eat F lux Measurement: Thermoelectric sensors; electric	05
	resistance sensors; thermistors; radiations pyrometers; Temperature measuring	
	problems in flowing fluids, dynamic compensation.	
8	DAS an d Signal A nalysis : Data acquisition system via computers. The	0.2
	components of Data acquisition system, DAS Hardware, selection criteria for	03
	choosing a DAS. Techniques for signal analysis. Signal conditioners - filters,	
	low, high, band pass and charge amplifiers.

9. Objective: To impart knowledge of surface related phenomena and technologies.

S. No.	Contents	Contact Hours
1.	Introduction: Concept and importance, classification of surface	3
	modification techniques, advantages and their limitations.	
2.	Surface Degradation: Causes, types and consequences of surface	8
	degradation, forms of wear: adhesive, abrasive, surface fatigue,	
	corrosive, fretting, and erosive wear, classical governing laws related	
	to wear, techniques to evaluate wear damage.	
3.	Materials for Surface Engineering: Materials characteristics, their	9
	importance in surface engineering, wear resistant materials, selection	
	of materials for engineering the surfaces for specific applications,	
	structure and property relationship of coatings system, new coating	
	concepts including multi-layer structures, functionally gradient	
	materials (FGMs), intermetallic barrier coatings and thermal barrier	
	coatings.	
4.	Surface Modification Techniques: Principles and application of	12
	weld surfacing: SMAW, SAW, GMAW, thermal spraying: flame	
	spraying, electric arc spraying, plasma spraying, detonation gun	
	spraying, and high velocity oxy fuel (HVOF) spraying; electro	

	deposition and electro less coatings, ion implantation, chemical vapour deposition (CVD) and physical vapour deposition (PVD).	
5.	Laser and Microwave assisted Surface Engineering: Laser cladding, alloying, glazing, laser and induction hardening, heat treatment of steel and remelting by laser; microwave glazing, microwave cladding.	6
6.	Characterization and Quality Assurance: Importance, introduction to different characterization techniques: physical, mechanical, and functional characterizations, surface finish, microhardness and strength.	4

8. Pre-requisite: Nil

S. No.	Contents	Contact Hours
1	Introduction: History of refrigeration and air-conditioning; trends in	1
	modern buildings for thermal comfort, pollution free environment and	
	indoor traffic management	
2	Vapour Compression Cycle :Carnot vapor compression Cycle; T-s	6
	and P-h diagrams of simple vapour compression refrigeration cycle;	
	Compressor volumetric efficiency. Effect of suction and discharge	
	pressure, subcooling and superheating on performance.	
3	Psychrometery: Psychrometric properties, psychrometric chart,	5
	simple and computerized psychrometrics, psychrometric processes;	
	Appreciation of indoor and outdoor conditions for a space in summer	
	and winter.	
4	Air Conditioning Processes: Summer and winter air-conditioning	6
	processes; Sources of thermal load in summer and winter using Load	
	Estimation Chart; Sensible Heat Factor (SHF). Evaporative Cooling	
	Systems.	
5	Infiltration and Ventilation: Driving mechanism of infiltration and	5
	ventilation; Indoor air quality; natural ventilation; Residential air	
	leakage; blower door test; Residential ventilation; Residential	
	ventilation requirements.	
6	Fenestration: Fenestration components; determination of energy	4
	flow; U-factor; solar heat gain and visible transmission; shading;	
	visual and thermal controls; air leakage; day lighting; selecting	
	fenestration: condensation resistance, occupant comfort and	
	acceptance.	
7	Building Cooling Load Calculations: Internal heat gain; system heat	6
	gain; ventilation load; cooling and heating load estimate;	
	psychrometric calculations for heating and cooling load.	

^{9.} Objective: To introduce the students to the areas of air-conditioning and ventilation in buildings; fenestration and transmission of air in the buildings.

8	Transmission and Distribution of Air: AHU;Room air distribution; friction loss in ducts; dynamic loss in ducts; air duct design; space air diffusion.	5
9	Design Conditions: Comfort air conditioning and effective temperature; comfort chart; choice of supply design conditions; Climate design conditions; generating design day data; clean spaces.	4

9. Objective: The course deals with the principles of combustion and their applications to the combustion systems..

S. No.	Contents	Contact Hours
1.	Introduction: Importance of Combustion, applications, brief overview of combustion generated pollution	2
2.	Thermodynamics of Combustion: Combustion Stoichiometry, enthalpy of formation, enthalpy of reacting systems, energy balance for reacting systems, enthalpy of reaction and heating values. Adiabatic flame temperature. Equilibrium criteria, equilibrium constant, equilibrium composition and flame temperature.	6
3.	Chemistry of Combustion Rate laws and reaction orders, elementary reactions, reaction Molecularity, temperature and pressure dependence of reaction rate, Arrhenius law, chain reactions, and reaction mechanisms. Steady state and partial equilibrium approximations. General oxidative and explosive characteristics of fuels, chain branching and explosion criteria, Explosion limits of Hydrogen-O ₂ CO-O, hydrocarbon $-O_2$ system, NO _x formation and its control	8
4.	Flame Processes: Rankine Hugonoit Relations, Deflagration and Detonation Different types of flames, laminar flame structure, laminar flame speed, effect of various chemical and physical parameters on flame speed, Flammability Limits, Stability Limits. Quenching and Flash Back,	

	Design of Burners	
	Turbulent Premixed Flames: Applications, Turbulent Flame Speed,	
	Structure of Turbulent Flames, Flame Stabilization, Turbulent	
	Nonpremixed Flames.	
	Combustion Process in SI engines	10
5.	Diffusion Flames:	
	Applications of diffusion flames, structure of diffusion flames,	
	Burke and Schumann development.	
	Burning of condensed Phases, liquid droplet combustion in quiescent	
	environment, effect of convection, spray combustion.	
	Combustion in CI engines	
		8
6	Combustion Generated Emissions:	
	Environmental consideration of combustion, Formation of NO _x and	
	its control, Particulate matter, SO _x , Staged burner, catalytic	
	converters, particulate traps	8

9. Objective: The course is intended for the post graduate students of mechanical engineering disciplines to give them a thorough understanding of a measuring system, different transduction principles, error analysis response etc. and various other issues related to instrumentation system.

S.	Particulars	Contact
No.		Hours
1	Significance of M easurement an d I nstrumentation: Introduction;	5
	generalized configuration and functional stages of measuring systems. The	
	transducer and its environment; an overview; sensing process and physical	
	laws. Types of measurement problems. Transducer classification and their	
	modeling; information, energy and incremental models	
2	Characteristics of Instruments: Objective of studying the characteristics of	3
	the instruments. Static characteristics, Static Calibration, design and selection	
	of components of a measuring system.	
3	Dynamic R esponse of I nstruments: Mathematical model of a measuring	5
	system, response of general form of instruments to various test inputs; time-	
	domain and frequency domain analysis.	
4	Errors in Measurement and Its Analysis: Causes and types of experimental	4
	errors; systematic and random errors. Uncertainty analysis; computation of	
	overall uncertainty; estimation for design and selection for alternative test	
	methods.	
5	Transducers an d T ransduction P rinciples: Developments in sensors, detectors and transducer technology; displacement transducers; force, torque and motion sensors; piezoelectric transducers; capacity type transducers; Strain gage transducers; accelerometers, pressure transducers based on elastic effect of volume and connecting tubing	8
---	--	----
6	Data A cquisition and Signal Processing: Systems for data acquisition and processing; modules and computerized data system; digitization rate; time and frequency domain representation of signals, and Nyquist criterion.	5
7	Flow Meas urement: Flow visualization, shadowgraph; schlieren and interferometric techniques; Pitot static tubes; hot wire anemometers; Laser Doppler velometer; flow measurements using coriolis effect.	6
	Temperature and Heat Flux Measurement: Thermoelectric sensors; electric resistance sensors; thermistors; radiations pyrometers; Temperature measuring problems in flowing fluids, dynamic compensation.	6

3	Finite Element in 2-D: Single variable problems in 2-D, applications to	8
	solid mechanics and heat transfer problems, numerical integration, higher	
	order shape functions, plane stress and plane strain problems.	
4	Basics of Extended Finite Element Method (XFEM): Brief introduction,	8
	partition of unity finite element method (PUFEM), generalised finite	
	element method (GFEM), introduction to XFEM, blending elements,	
	concept of level sets and enrichment	
5	Engineering Applications: XFEM on element level: shape functions,	8
	displacement, strain, element stiffness matrix, XFEM for weak and strong	
	discontinuities e.g. e.g. static cracks, crack growth, bi-materials, phase	
	change problems.	
6	Advanced Concepts of XFEM: Concept of phantom nodes, tracking the	8
	crack path, embedded elements, interface elements, introduction to cohesive	
	zone models, embedded elements, crack initiation/propagation, smeared	
	cracks.

8.	Pre-requisite: N	il					

9. Objective: To cover concepts, techniques and tools for modeling and simulation of thermal systems.

10. Details of Course:

S. No.	Contents	Contact Hours
1.	Introduction to Modeling : Concept of system, continuous and discrete systems, types of models, steps in simulation study.	2
2.	Mathematical P reliminaries: Review of vector calculus, Cartesian tensors, vector spaces and linear transformations; Interpolation and extrapolation; Numerical differentiation and integration.	6
3.	Discrete and Continuous systems: Continuous and discrete systems from fluid mechanics and heat transfer; Characteristics of discrete systems, eigenvalue problems; Characteristics of continuous systems based on differential equations; Inverse problems.	6
3.	Mathematical M odeling of T hermal P rocesses: Conservation laws, mass, momentum and energy balance; Classification of governing equations, boundary conditions; Dimensional analysis, model development for various thermal processes and system; Dynamics of thermo-fluid systems.	10
4.	Simulation of T hermal S ystems: Numerical methods for solution of partial and ordinary differential equations; Numerical solution of linear and nonlinear algebraic equations; Numerical simulation of steady state and	12

	dynamic systems.	
5.	Optimization of Thermal S ystems: Introduction to optimization, formulation of objective function, constrained single and multivariable optimization, dynamic integer and geometric programming.	6
	Total	42

Laboratory C omponent: Students will be required to develop mathematical models and computer programs for numerical simulation of various thermal systems.

- 9. Objective: To teach students various tools and techniques used for the performance analysis of manufacturing systems.
- 10. Details of Course:

S.	Contents	Contact
No.		Hours
1	Introduction: Definitions of manufacturing with input-output model, definition of system, basic problems concerning systems and system design procedure, modes of manufacturing – job/batch/flow and multi-product, small-batch manufacturing.	4
2	System Modeling Issues: Centralized versus distributed control; Real-time vs. discrete event control; Forward vs. backward scheduling approaches with finite/infinite capacity loading; Modeling of absorbing states and deadlocks; Conflicts; Concurrency, and synchronization etc.	8
3	System Modeling Tools and Techniques: Introduction to mathematical modeling, optimization, and simulation; Issues related with deterministic and stochastic models; Continuous and discrete mathematical modeling methods - discrete event, monte carlo method; Basic concepts of Markov chains and processes; The M/M/1 and M/M/m queue; Models of manufacturing systems - including transfer lines and flexible manufacturing systems, introduction to Petri nets.	15

4	Performance Analysis: Transient analysis of manufacturing systems, analysis	15
	of a flexible machining center; Product flow analysis; Rank order clustering;	
	Process flow charting; MRPI & II, kanban, OPT, JIT-pull and JIT-push, line of	
	balance, effects of machine failure, set-ups, and other disruptions on system	
	performance; Calculation of performance measures - throughput, in-process	
	inventory, due dates, MTL, capacity, and machine utilization etc.; Critique of	
	high inventory, long lead time systems; Shop floor control issues.

- 8. Pre–requisite: Nil
- 9. Objective: This course is designed to provide basic knowledge of artificial intelligence. The emphasis is on the teaching of various techniques on knowledge representation and search engines with important applications of AI.
- 10. Details of Course:

S.	Contents	Contact
No.		Hours
1	Overview of History and Goals of AI: Artificial Intelligence Definition,	3
	components, scope, and application areas; Turing's test; Review of AI success and failure	
2	State Spaces, Production Systems, and Search: State space representation	8
	of problems; Problem solving using search; Definition and examples of	
	production systems; Heuristic search techniques i.e. generate-and-test, hill	
	climbing, best-first search, constraint satisfaction and mean-ends analysis.	
3	Knowledge Representation: Definition of knowledge; Issues in knowledge	9
	representation; Procedural vs declarative knowledge and their	
	representation; Predicate logic, production rules, semantic nets, and frames;	
	Meta-knowledge.	
4	Reasoning and Inference Strategies: Forward vs backward reasoning;	10
	Depth first, breadth first, min-max etc.; Non-monotonic reasoning;	
	Symbolic reasoning under uncertainty; Probability and Baye's theorem;	
	Certainty factors, Dempster-Shafer theory; Fuzzy logic etc.	
5	Expert Systems and their Applications : Justification, structure, knowledge	12
	sources; Expert knowledge acquisition; Expert system languages; ES	
	building tools/shells; Applications of AI in CAD, CAPP, process selection,	
	GT, MRP II, adaptive control, robotics, process control, fault diagnosis,	
	failure analysis, etc.

2.	Solar radiation: Sun, solar radiations, attenuation by atmosphere, solar radiation on earth, measurement, presentation and utilization of data.	6
3.	Heat transfer concepts: Radiation characteristics of surface and bodies, absorbance, reflectance and transmittance, selective surface, sky radiation and wind convection.	6
4.	Flat plate collectors: General description of flat plate collectors, general characteristics, performance, short term and long term performance, design.	8
5.	Focusing collectors: General description of focusing solar collectors, concentrators, receivers and orienting systems, general characteristics, performance, materials, design.	5
6.	Energy storage: Energy storage in solar process system, different types of storages, characteristics and capacity of storage medium, solar pond.	5
7.	Solar heating and cooling: Passive heating and cooling, nocturnal radiations, green house concept, ponds, active heating and cooling, solar water heaters, absorption cooling, combined solar heating and cooling systems, performance, economics of solar heating and cooling.	4

8.	Solar Process Modeling: Solar process systems and components, component models, system models.	2
9.	Solar Photovoltaics: Description and principle of working, performance characteristics, efficiency of solar cells, module design, PV systems, applications.	4

8. Pre-requisite: Nil

- 9. Objective: To provide knowledge of advanced topics in gas dynamics related to shock waves, perturbations and methods of characteristics.
- 10. Details of Course:

S.	Contents	Contact
No.		Hours
1.	Basic E quations: Application of the general differential equation of continuity, momentum and energy to compressible inviscid fluids, compressible Bernoulli equation, irrotational flow, velocity potential and stream function.	6
2.	Shock Waves in Supersonic Flow: A review of normal shock relations, Mach waves, equations for finite strength oblique shock waves, Rankine-Hugoniot relations, extended Prandtl relation, hodograph shock polars, reflection and interaction of shock, curved shocks.	7
3.	Small Perturbation T heory: Linearization, small perturbation equation, pressure coefficient, subsonic flow past a wave shaped wall, general solution of supersonic flows, supersonic flow past a wave – shaped wall, elements of supersonic thin aerofoil theory.	9
4.	Similarity Rules: Similarity rules between two-dimensional subsonic compressible flows and incompressible flows, Gothert rule, PrandtlGlauert rule, application to supersonic flows.	6

5.	Hodograph Method for Subsonic Flow: Hodograph equations for two-dimensional	7	
	subsonic flows, Chaplygin's equation, the tangent gas approximation of Karman and		
	Tsien for subsonic flows, Karman-Tsien formula for pressure correction, comparison		
	with Prandtl-Glauert rule		
6.	Method of Characteristics for Supersonic Flow: Method of characteristics for two	7	
	dimensional supersonic flows, the characteristic curves, equation of hodograph		
	characteristics, characteristics network, computational methods.

8. Pre-requisite: Nil

9. Objective: This course will provide an exposure regarding Renewable Energy Systems towards sustainable development of the society.

S.	Particulars	Contact
No.		Hours
1	Introduction: Energy and development, energy demand and availability, energy crisis,	6
	conventional and non-conventional sources, renewable and non-renewable energy	
	resources, environmental impact of conventional energy usage, basic concepts of heat	
	and fluid flow useful for energy systems.	
2	Solar E nergySystems: Solar radiations data, solar energy collection, storage and	7
	utilization, solar water heating, solar air heating, solar power generation, solar	
	refrigeration and air conditioning, solar energy system economics.	
3	Micro And Small Hydro Energy Systems: Resource assessment of micro and small	6
	hydro power, micro, mini and small hydro power systems, economics, pump as turbine,	
	special engines for low heads, velocity head turbines, hydrams, water mills.	
4	Biomass Energy Systems: Availability of biomass- agro, forest, animal, municipal and	6
	other residues; Bioconversion technologies; cooking fuels, biogas, producer gas, power	
	alcohol from biomass; Power generation, internal engine modifications and performance,	
	system economics.	
5	Wind Energy Systems: Wind data, horizontal and vertical axis wind mills, wind farms,	6
	performance and economics of wind energy.	

6	Geothermal Energy Systems: Vapor dominated, liquid dominated and petrothermal	3
	systems; Hybrid systems.	
7	Energy from t he O ceans: OTEC systems, open and closed types; Wave energy	4
	conversion systems; Tidal energy conversion systems.	
8	Integrated E nergy Systems: Concept of integration of conventional and non-	4
	conventional energy resources and systems; integrated energy system design and	
	economics.

8. Pre-requisite: Nil				

9. Objective: To introduce the students the basic design principles of refrigeration and Air conditioning equipment and component such as evaporators, condensers, capillary tubes, expansion valves, etc.

S. No.	Contents	Contact Hours
1	Load Calculations: Solar heat gains through structures; review of	3
	refrigeration and air conditioning load calculations.	
2	Refrigeration Systems: Vapour compression; multiple evaporator and compound compression system with and without inter cooling; dual compressors; cascade systems; Vapour absorption system- analysis. Solid carbon dioxide; principle of production; three stage system with water and flash inter-cooler; pressure snow chambers; regenerative	6
	liquid; binary system.	
3	Compressors: Performance characteristics and capacity control of reciprocating, rotary and centrifugal compressors; screw compressors; hermetically sealed units; analysis of centrifugal compressors. Compressor Design.	5
4	Condensers: Water —cooled and air-cooled condensers; overall heat transfer coefficients; fouling factor; performance characteristics and design; performance and heat transfer processes in evaporative condenser.	5
5	Evaporators: Flooded and dry expansion type evaporators, liquid chiller, overall performance of evaporators and design of evaporators.	4
6	Expansion Devises: Capillary tubes; system design factors; pressure and temperature distribution; ASHRAE simplified calculation	4

	procedure. Expansion valves; operation and performance calculation of thermostatic expansion valve; application of constant pressure expansion valve.	
7	Thermal Comfort: Human thermoregulation; energy balance; thermal exchange with environment	3
8	Indoor Environmental Health and Air Contaminants: Airborne contaminants: particles, gaseous contaminants, outdoor air ventilation and health;	5
9	Pressure Drop and Heat Transfer: Two phase flow; flow regimes; maps; pressure drop in evaporator and condensers; Martinelli relation	4
10	Applications and System Design: Ice manufacture; Design of refrigerated ware houses. datacentre and clean room.	3

- 9. Objective: To introduce the students the basic physiological principles, comfort charts, air conditioning systems and the design of piping and ducts.
- 10. Details of Course:

S. No.	Contents	Contact Hours
1	Psychrometery: moist air properties; mass transfer and evaporation	6
	of water into moist air; theory of psychrometer; correlation of w.b.t.	
	with temperature of adiabatic saturation; Lewis number; construction	
	of psychrometric chart.	
2	Physiological Principles: Comfort; thermal interchanges with	4
	environment; physiological body regulatory processes against heat or	
	cold ; high and low temperature hazards; extreme environmental	
	conditions; heat stress index; ASHRAE comfort standards.	
3	Simultaneous Heat and Mass Transfer: Direct contact transfer	6
	equipment; simple air washer and indirect evaporative cooling contact	
	mixture principle; enthalpy potential; basic equation for direct contact	
	transfer equipment; graphical and analytical methods for heat and	
	mass transfer analysis of air washers with heated and chilled water	
	sprays; cooling towers.	
4	Extended Surface Heat Transfer Apparatus: Cooling and	8
	Dehumidifying coils, Design of finned surfaces, Adsorption cooling	
	systems.	
5	Ventilation: Necessity; ventilation standards; natural and mechanical	6
	ventilation; forces for natural ventilation; general ventilation rules;	
	advantages of mechanical ventilation; various methods; ejector	
	systems ; determining ventilation requirement; use of decay equation.	
6	Air Cleaning: Physical and chemical vitiation of air; permissible	4
	concentration of air contaminants; mechanical and electronic air	

	cleaners; dry and wet filters; air sterilization; odour control.	
7	Steam Heating Systems: Elements of steam, water and warm-air	4
	heating systems; radiators and convectors. Design of an year-round air	
	conditioning system.	
8	Piping and Ducts: Pressure drops in piping and fittings; design of	4
	water and refrigerant piping; Air conditioning duct design methods.

- 8. Pre-requisite: Nil
- 9. Objective: The course is intended to train the graduates in methods of failure analysis and design of machine parts against likely failures, using advanced concepts and also to design for reliability.
- 10. Details of Course:

S.	Contents	Contact
No.		Hours
1	Introduction: Review of failure theories, their scope of applications under different	12
	loading and environmental conditions, Hertzian contact stresses and their effect on	
	load carrying capacities of members, effect of small inelastic strains and residual	
	stresses on load carrying capacity, theory of limit design; Machinery construction	
	principles.	
2	Designing against Fracture: Linear elastic fracture mechanics approach, theories of	10
	brittle fracture, fundamental aspects of crack growth and fractures, use of fracture in	
	design.	
3	Designing agai nst F atigue an d C reep: Causes and interpretation of failures,	10
	influence of various factors, low cycle and high cycle fatigue, cumulative damage	
	theories, acoustical and thermal fatigue, corrosion and fretting fatigue, pitting of	
	gears, fatigue strength of joints, components and structures; creep behavior; the	
	mechanical equation of state, an elastic and plastic creep, rupture theory, analysis of	
	tensile creep data, creep in high temperature low cycle fatigue, creep analysis of	
	thick walled cylinders and rotating discs.	
4	Design for Reliability: Application of statistics to material properties, fatigue and	10
	reliability, early chance and wear out failures, reliability prediction against chance	
	and wear out failures, probabilistic approach to design and its comparison with safety	
	factor approach, reliability prediction of series, parallel and stand by systems.

- 9. Objective: To impart knowledge of principles governing the motion of mechanical systems and to develop their skills in analysis and control of their motion.
- 10. Details of Course:

S.	Contents	Contact
No.		Hours
1	Basic concepts: Inertial coordinate system, fundamental laws of motion, mechanics	4
	of particles and system of particles, principles of linear and angular momentum,	
	work-energy principles.	
2	Lagrangian dynamics: Degrees of freedom, generalized coordinates and	10
	generalized forces, holonomic and non-holonomic constraints, Lagrange's equation	
	from d'Alembert's principles, application of Lagrange's equation for conservative	
	and non-conservative autonomous systems with holonomic and non-holonomic	
	constraints, applications to systems with very small displacements and impulsive	
	motion; Hamilton principle from d'Alembert's principle, Lagrange equation from	
	Hamilton's principle.	
3	Multi-body dynamics: Space and fixed body coordinate systems, coordinate	15
	transformation matrix, direction cosines, Euler angles, Euler parameters, finite and	
	infinitesimal rotations, time derivatives of transformations matrices, angular	
	velocity and acceleration vectors, equations of motion of multi-body system,	
	Newton-Euler equations, planer kinematic and dynamic analysis, kinematic	
	revolute joints, joint reaction forces, simple applications of planer systems.	
4	Stability of motion: Fundamental concept in stability, autonomous systems and	7
	phase plane plots, Routh's criteria for stability, Liapunov's method, Liapunov's	
	stability theorems, Liapunov's function to determine stability of the system.	
5	Control system dynamics: Open and close loop systems, block diagrams, transfer	6
	functions and characteristics equations, proportional integral and derivative control	

actions and their charac	cteristics.

- 9. Objectives of Course: The course aims at providing advanced concepts in behavior of solids under various loading conditions and to train the graduates in analyzing the resulting stresses and deformations.
- 10. Details of Course:

S. No.	Particulars	Contact
		Hours
1	Mathematical P reliminaries: Scalars, vectors and matrix variables, index	4
	notation and the related rules, Cartesian tensors and their algebra, co-	
	ordinate transformation, transformation rules for the n^{th} order tensors,	
	elements of tensor calculus and the related theorems (divergence, Stokes'	
	and Green's), principal value theorem, eigenvalues and eigenvectors,	
	invariants of a 2 nd order tensor.	
2	Kinetics of D eformation: Types of forces (point, surface and body),	8
	traction vector, state of stress at a point, Cauchy's relation and its proof,	
	conservation of linear and angular momentum, stress equilibrium equations,	
	symmetry of stress tensor, stress transformation, principal stresses and the	
	associated planes, 3D Mohr's circle representation, planes of maximum	
	shear, octahedral planes, hydrostatic and deviatoric stress, first and second	
	Piola-Kirchoff stress tensors and their properties.	
3	Kinematics of D eformation: Material and spatial co-ordinates, Eulerian	8
	and Lagrangian description of motion; deformation and displacement	
	gradients, Green-Lagrange and Almansi strain tensor; Cauchy's small strain	
	tensor and the rotation tensor, geometrical interpretation of strain	
	components and sign convention, principal strains and directions, strain	
	invariants, octahedral strain, maximum shear strain, volumetric strain, strain	
	compatibility equations.	

4	Constitutive Modeling : Thermodynamic principles, first and second law of thermodynamics, Generalized Hooke's law for isotropic materials, elastic constants and their relations, anisotropic, hyperelastic and viscroelastic material models, strain hardening, constitutive relations for elasto-plastic materials, flow and hardening rules.	8
5	Boundary Value P roblems i n L inear E lasticity : Field equations and boundary conditions, Navier equations, Beltrami-Michell stress compatibility conditions, 2D approximations (plane stress and plane strain) and solution strategies.	6
6	Variational P rinciples in S olid M echanics : Elements of variational calculus, extremum of a functional, Euler-Lagrange equation and its application, types of boundary conditions, principle of virtual work, Principle of total potential energy and complementary potential energy, Ritz method, time-dependent problems and Hamilton's principle for continuum.	8

S.	Contents	Contact
No.		Hours
1	Introduction: Importance of experimental methods and their scope, whole field and	2
	point by point methods.	
2	Photoelasticity: Nature of light, photoelastic effect and polarized light, permanent	8
	and temporary birefringence, types of polariscopes and their basic elements, optics	
	of plane and circular polariscope, isoclinics and isochromatics, stress optic law and	
	secondary principal stresses; Photoelastic model materials their properties and	
	selection, preparation of models, transition from model to prototypes, measurement	
	of relative retardation and fringe order, compensation techniques, separation of	
	principal stresses by oblique incidence, shear difference and numerical integration	
	of Laplace's equation.	
3	Photoelastic methods: Calibration methods and determination of stress trajectories	4
	from isoclinic data; Basic elements of three dimensional photoelasticity, stress	
	freezing and slicing the model and interpretation of the resulting fringe patterns,	
	fringe sharpening and fringe multiplication techniques; Photoelastic methods to	
	determine stress intensity factors.	
4	Birefringent Coatings: Surface stress determinations using birefringent coatings,	6
	sensitivity of biregringent coatings; Reinforcing, thickness and other effects of	
	photoelastic coatings; Separation of principal stresses; Birefringent coating	
	materials and applications; Photoelastic stress and strain gauges.	

5	Scattered L ight P hotoelasticity: Scattering phenomenon and polarization	5
	associated with scattering, scattered light technique to solve general three	
	dimensional problem; Scattered light polariscope.	
6	Moire Method of Strain Analysis: Moire phenomenon and formation of Moire	5
	fringes; Geometric and displacement approach for in-plane problems, Moire grating	
	production, printing and photography.	
7	Brittle C oatings: Introduction, coating stresses; Brittle coating failure theories;	6
	Factors affecting analysis of coating data; Crack patterns due to direct and	
	relaxation loading; Refrigeration technique, calibration methods and scope of	
	application of brittle coating method.	
8	Digital I mage Processing: Fringe multiplication, fringe thinning and fringe	6
	clustering through data acquisition by DIP methods; Phase shifting, polarization	
	stepping and Fourier transform techniques phase unwrapping and optical enhanced	
	tiling, use of colour image processing techniques for data acquisition in digital	
	photoelasticity.

- 9. Objective: To introduce the mechanics of anisotropic material and to provide insight into different failure mechanisms typical of anisotropic and heterogeneous systems.
- 10. Details of Course:

S.	Contents	Contact
No.		Hours
1	Introduction: Composite materials, characteristics, classification, advantages	2
	and typical problems.	
2	Unidirectional L amina: Introduction, longitudinal strength and stiffness,	6
	transverse strength and stiffness, failure modes, thermal expansion and transport	
	properties.	
3	Short Fibre Composites: Theories of stress transfer, modulus and strength of	4
	short fibre composites.	
4	Analysis of a n O rthotropic L amina: Hook's law, stress-strain relation for	6
	lamina with an arbitrary orientation, strength of a lamina subjected to biaxial	
	stress field.	
5	Analysis of Laminated C omposites: Classical lamination theory, thermal	12
	stress in laminates.	
6	Special D esign C onsiderations: Analysis after initial failure, inter-laminar	8
	stress, free edge effect, design of joints, elementary fracture mechanics concepts	
	related to composite materials.	
7	Experimental Characterization: Uni-axial tension test, compression test, in-	4
	plane shear test, three and four point bending test, determination of interlaminar	
	shear strength.

- 9. Objective: To impart fundamental knowledge of the subject on noise control problems in mechanical systems.
- 10. Details of Course:

S.	Contents	Contact
No.		Hours
1	Introduction: Sound vs noise; Time and frequency domain representation,	6
	hearing mechanism assessment of noise, its units, human response to noise of	
	different types- stead, fluctuating and impulsive, physiological effects of noise,	
	control of noise, need, concepts and options, and its relation to vibrations.	
2	Homogeneous Wave Equation: Linearized wave equation, acoustic velocity	6
	potential acoustic impedance, plane wave propagation, intensity, energy density	
	and power, Simple Source models, monopole, dipole, quadrupole and linear,	
	effect of proximity of rigid boundaries, directivity patterns.	
3	Inhomogeneous Wave Equation and Aerodynamic Noise Theory: Effect of	7
	solid bodies in flow, vortex flow; Ray Acoustics propagation of sound	
	outdoors, divergence, excess attenuation factors, effects of wind, temperature	
	gradient and turbulence anomalous propagation, shadow zones, ground and	
	terrain effects, harriers, cuttings and elevation.	
4	Wave-Structure Interaction: Sound radiation from plates infinite and bounded;	6
	radiation ratio, sound transmission through layered media, behavior of infinite	
	and finite panels, coincidence phenomena and design curves, sound transmission	
	loss, fluid loading on structure, impact noise, introduction to statistical energy	
	analysis.	
5	Instrumentation: Sound measuring equipment, microphones, preamplifiers,	5
	sound level meters, recorders, frequency analysers statistical measurements, FFT	
	analysers.	

6	Noise Control Principles: Control strategies and limitations, integrated	8
	approach to low noise design, typical mechanical noise sources, mechanism of	
	noise generation- vibration, impact, flow excitation, control of solid borne and	
	air-home noise, concept of impedance mismatch, filters, silencers, damping,	
	enclosure, absorbers, active noise control principle.	
7	Case Studies: Noise control in reciprocating and rotating machinery, and fluid	4
	flow systems: e.g., gears, bearing, piping systems, automobiles, aircrafts,	
	refrigeration and air conditioning systems elements, machine tools, presses etc.,	
	environmental noise control and receiver protection.

1. Subject Code: MIN-566 Course Title: Computer Aided Analysis of Mechanical Systems

- 8. Pre–requisite: Nil
- 9. Objectives: To introduce computer-based design tools for analyzing the kinematics and dynamics of mechanical systems.
- 10. Details of Course:

S.	Particulars	Contact
No.		Hours
1	Introduction: Introduction to mechanical systems analysis.	2
2	Kinematic Modeling: Modeling the kinematics of mechanical systems;	4
	Vector loop methods, vector chain methods.	
3	Solution of Kinematic Models: Solution of kinematic models for	8
	displacements, velocities, accelerations; Direct analytical solutions of	
	position, velocity, acceleration problems; Numerical solution of position	
	problem; Matrix method solutions of velocity and acceleration problems.	
4	Dynamic Modeling: Modeling the dynamics of mechanical systems;	6
	Newton-Euler methods to define dynamic constraints between forces,	
	moments, and accelerations, energy methods to define dynamic constraints	
	between input and output links.	
5	Solution of Dynamics Models: Solution of inverse dynamics models for	14
	joint-link forces and torques, solution of forward dynamics models using	
	numeric integration, model formulation into standard format for solution,	
	Euler's method of integration, Runge-Kutta methods of integration,	
	modeling and analysis of the Trebuchet mechanism.	
6	Advanced Dynamic Analysis & Simulation: Bond graph modeling of	8
	dynamic systems, generation of system equations, causality, and	
	simulation.

8.	Pre – requisite: Ni	l				

- 9. Objective: To introduce various components of numerically controlled machine tools and their application in automated manufacturing systems.
- 10. Details of Course:

S. No.	Contents	Contact Hours
1	Machine Tool Design : General requirements; Electrical and hydraulic drives of machine tools; Layout of gear boxes; Hydraulic, electric and mechanical stepless speed regulations; Design and analysis of guideways; Bed; Column and Spindle.	16
2	Numerical Control (NC): Introduction to numerical control; Components of NC systems; Open and close loop NC; Types of numerical control: Point-to-point, straight cut, and continuous path NC; Drives and controls; NC-tape coding standards.	04
3	NC Part Programming Methods : Structure of NC part program; NC word formats; Introduction to G and M codes; Manual programming methods; Computer-assisted programming methods; APT part programming.	10
4	Extensions of NC : Concepts of CNC, machining center, and DNC; CNC and DNC efficiency; Tooling for NC/CNC.	04
5	CNC Part Programming : Tool motion commands; Tool length offset; Cutter diameter compensation command; fixed cycle command; Scaling; rotation; Mirror image; Macros programming etc.	08

8.	Pre-requisite: Nil		

9. Objective: To expose the students to the field of Welding Engineering and to let them understand the concepts, processes, affecting parameters related to welding. The course deals with fundamentals of arc welding processes, metal transfer and weldability of metals as well.

10. Details of Course:

S. No.	. Contents	
		Hours
1	Introduction: Welding as compared with other fabrication processes, Classification of	02
	Welding Processes	
2	Physics of Welding Arc: Welding arc, arc initiation and maintenance, voltage	10
	distribution along the arc, cathode and anode drops, Arc column, Thermionic and non	
	thermionic cathode, Theories of cathode and anode mechanisms, arc characteristics,	
	arc efficiency, heat generation at cathode and anode Effect of shielding gas on arc,	
	isotherms of arcs, arc blow.	
3	Metal Transfer: Mechanism and types of metal transfer in various arc welding	04
	processes, factors controlling melting rate in various welding processes.	
4	Welding Power Sources: Basic characteristics of power sources for various arc	05
	welding processes, arc length regulation in mechanized welding processes,	
	Transformer, rectifier and generators, Duty cycle and power factor, Static and	
	dynamic characteristics of power sources.	
5	Welding Processes: Critical review of MMA; TIG. MIG and CO ₂ welding processes,	12
	plasma arc, submerged arc welding, electro- gas and electro-slag welding; resistance	
	welding. Theory and mechanism of solid state welding; technique and scope of	
	friction welding, diffusion welding; cold pressure welding and ultrasonic welding,	
	scope and application of electron beam and laser welding processes.	
6	Heat Flow in Welding: Calculation of peak temperature; width of Heat Affected	04
	Zone; cooling rate and solidification rates; weld thermal cycles; residual stresses and	
	their measurement; weld distortion and its prevention.	

7	Weldability of Metals: Effects of alloying elements on weld ability, welding of plain	05
	carbon steel, stainless steel, Cast Iron and aluminium.

Solidification : Solidification of pure metals and alloys, nucleation and growth in alloys, solidification of actual castings, progressive and directional solidification, centerline feeding resistance, rate of solidification, Chvorinov's Rule, electrical analog of solidification problem; Fluidity- measurement of fluidity, effects of various parameters on fluidity	8
3.	Risering and Gating System : Riser design, risering curves, NRL method of riser design, feeding distance, risering of complex casting, risering of alloy other than steel, recent developments in riser design by the application of geometrical programming; Gating systems and their characteristics, the effects of gates on aspiration, turbulence and dross trap, recent trends.	5
4.	Pattern and Casting Design : Pattern design, recent developments in pattern design, materials and construction; Casting design considerations- review of casting design, recent trends.	9
5.	Melting, Molding and Core Making Processes: Selection and control of melting furnaces, boiling, refining and pouring, recent trends in cupola design; Review and critical comparison of various established processes, recent developments e.g. low pressure and ferrous die casting, high pressure molding, full mold process, flaskless molding, hot and cold box molding, ceramic shell molding, V-process, continuous casting, squeeze and pressed casting, Nishiyama process, Shaw process, Anitoch process etc.	6
6.	Internal Stresses, Defects and Surface Finish: Residual stresses, hot tears and cracks in castings, stress relief, defects and their causes and remedies, various parameters affecting surface finish and related defects e.g. rough casting, sand bum-	7

	on sand bum-in and metal penetration, facing and washes, mold wall movement,	
	vapor transpol1 zones, expansion scabbing etc; Gases in metal- methods of	
	elimination and control of dissolved gases in castings.	
	Testing, Inspection and Quality Control: Testing of sand, recent developments e.g.	4
7	mulling index, moldability index, compactability; deformability; Review of X-ray and	
7.	gamma ray radiography, magnetic particle, die penetrant and ultrasonic inspection,	
	use of statistical quality control in foundry.

- **9. Objectives of Course:** This course covers the details of various non-traditional/unconventional or advanced machining processes (AMPs).

10. Details of Course:

S.	Particulars	Contact
No.		Hours
1	Introduction: Types of advanced manufacturing processes; Evolution, need, and	02
	classification of advanced machining processes (AMPs).	
2	Mechanical Type AMPs: USM, Rotary Ultra Sonic Machining (RUM), AJM, WJM,	08
	AWJM processes - Process principle and mechanism of material removal; Process	
	Parameters; Process Capabilities; Applications; Operational characteristics;	
	Limitations.	
3	Advanced Fine Finishing Process: Abrasive Flow Machining (AFM), Magnetic	06
	Abrasive Finishing (MAF), Magneto Rheological Abrasive Finishing (MRAF) -	
	Process principle; Process equipment; Process Parameters; Process Capabilities;	
	Applications; Limitations.	
4	Chemical Type AMPs: Process principle and details of Chemical Machining (CHM),	04
	Photo-Chemical Machining (PCM), and Bio-Chemical Machining (BCM) processes.	
5	Electro Chemical Type AMPs: ECM - Process principle; Mechanism of material	06
	removal; Process Parameters; Process Capabilities; Applications	
6	Thermal Type AMPs: EDM, Wire Electro Discharge Machining (WEDM), LBM,	08
	EBM, IBM, PAM processes – Process principle and mechanism of material removal;	
	Process parameters and characteristics; Surface finish and accuracy, Process	
	Capabilities; Applications; Limitations.	
7	Derived and Hybrid AMPs: Electro Stream Drilling (ESD), Shaped Tube Electro	08
	Machining (STEM), Electro Chemical Honing (ECH), Electro Chemical Deburring	
	(ECDE), Electro Chemical Discharge Machining (ECDM) - Process Parameters;	
	Process Capabilities; Applications; Limitations, Introduction to form machining.

- 8. Pre-requisite: nil
- 9. Objectives: The aim of the course is to provide theoretical and practical details of various nonconventional welding/joining processes and techniques including high energy density welding processes.

10. Details of Course:

S. No.	Contents	
		Hours
1.	Resistance Welding: Principle of contact resistance; calculation of current, time and	10
	voltage for spot welding, choice of electrode material; electrode shapes; shunt	
	current; shop tests for soundness of spot welds, seam, projection, butt and flash	
	welding; selection of welding and other process details; stud welding; power sources	
	for resistance welding.	
2.	High Power Density Welding Processes: Electron Beam (EB) welding in different	4
	degrees of vacuum, applications; Laser welding; principle of operation; laser	
	materials, applications.	
3.	Solid State Welding Processes : Fundamental principles of various non- conventional	8
	pressure welding processes and their applications; friction, explosive, diffusion and	
	ultrasonic welding; induction welding.	
4.	Special Topics: Soldering; brazing and braze welding; welding of plastics.	5
5.	Cutting and Surfacing : Plasma and thermal cutting and surfacing operations;	8
	parameters; consumables; and equipment; arc and gas gouging.	
6.	Safety Measures in Welding: Various safety measures for conventional and non-	7
	conventional welding processes. Gas cylinder colour codes; storage and	
	transportation of gases; protection from fire and explosions. Protection against	
	electric shocks and short circuiting; chemistry and mechanism of formation of	
	fumes; effect of fumes; radiations and noise on welder's health; eye flash, skin burn,	
	heat exhaustion and other diseases; protective devices such as exhaust hoods, booths,	
	shields, goggles, screens, clothing and ear covers; safety during welding in confined	
	spaces.

9. Objectives of Course: Objective of this course is to provide knowledge of safety of welded structure primarily in reference to various consequences of stress and strain state, loading conditions and susceptible mode of fracture. The course is also intended to cover different methods of safety analysis of welded structure using fracture mechanics concepts.

S. NO.	Contents	
		Hours
1.	Basis of Safety Concept : Definition of safety and definition of safety concept; Basic mechanism of failure of components; Brittle and ductile fracture; Collapse fatigue fracture mechanism and representations at sub-microscopic and macroscopic levels through Mohr's Circle; Specific problems of safety related to weldments; Definition and safety relevance of weld imperfections.	8
2.	Conventional Methods for Safety Analysis : Concepts of strength and toughness of engineering materials; Determination and consequences of stress and strain state; Material - stress and strain state embitterment, their reasons and consequences; Effects of notches, stress state in notched component, safety analysis and assessment of notched components using notch theory; Semi quantitative Fracture Analysis Diagrams (Pellim's FAD); limitations of conventional methods.	8
3.	Fracture Mechanics: Concepts of stress-strain state of cracked components; Introduction and basic principles of fracture mechanics; Linear Elastic Fracture Mechanics (LEFM); Stress intensity factor; Determination of fracture toughness.	9
4.	Methods for Safety Analysis: ASTME:399 method; Limitations of LEFM; Modified LEFM (ASTME 1820); General yielding criterion; Plastic Limit Load Calculations (PLLC); Principles of Two Criteria Approach (TCA); Failure assessment diagram (CEGB Report R-6); Mechanism of cyclic crack growth; Paris law; Modifications of Paris law; Effects of temperature and environment; Elastic plastic fracture mechanics (EPFM); Stable crack growth; COD concept (CTOD BS: 5762); R-curve technique; Instability diagram.	9
5.	Application of Safety Concepts to Welded Structures: Material imperfections and stress states in weldments; Quality - degradation in welded structures; CODE	8

requirements; Case studies as examples of failures; Design and service requirements for engineering structures fabricated by welding i.e. welded structures.

Examination Duration (Hrs): Theory: **Practical:** 3 0 CWS MTE PRS ΓЕ RE 4. Relative Weightage: 25 0 25 50 0 5. Credits: 4 6. Semester: Spring 7. Subject Area: PEC

- 8. Pre-requisite: Nil
- 9. Objectives: The aim of the course is to provide theoretical and practical details of solid state welding/joining processes and their significance in manufacturing.

S.	Contents	
No.		Hours
1.	Joining defined; Fundamental forces involved in joining; Mechanical fastening and integral attachment: using mechanical forces; Adhesive bonding: using chemical forces; Welding: using physical forces; Overview of fusion and solid state welds; Fundamental principles of solid state welding processes; Classification of solid state/non-fusion welding processes.	8
2.	Adhesive bonding as a joining process; General description of adhesive bonding; Cementing and mortaring as an adhesive joining process; The functions of adhesives; Mechanisms of adhesion; Failure in adhesive- bonded joints; Adhesive joint designs; Design criteria and analysis of adhesive joints.	8
3.	Friction welding process; application of friction welding process; friction welding process parameters; radial and orbital friction welding; direct drive and inertia drive friction welding; study of friction welds; joint quality of friction welds.	8
4.	Overview of friction stir welding (FSW) process principles; welding tools used for FSW; Parameters' effects; Materials used with FSW;thermomechanical aspect of FSW; Plastic deformation in relation to material properties; Material flow and property relationships of the resultant FSW joint, friction stir processing (FSP), process parameters of FSP; Application of FSW and FSP processes.	10
5.	Diffusion joining processes: conventional diffusion, deformation diffusion, resistance diffusion & continuous seam diffusion welding; diffusion brazing; braze welding, combined forming and diffusion welding; solid-state deposition welding processes. Pressure non-fusion welding processes: cold welding processes, pressure gas welding process,	8

forge welding process; Roll welding; Explosion welding process.

- 8. Pre-requisite: Nil
- 9. Objective: The aim of this course is to provide the fundamental understanding on weldability of metals of commercial importance like steels, cast iron and Aluminum besides various problems encountered their remedies and precautions to be undertaken during the welding of the above mentioned metals.

S. No.	Contents					
1.	Fundamentals : Weldability, definitions, factor affecting the weldability of steel	4				
	Carbon equivalent, solidification of weld metal; heat affected zone (HAZ), factors					
	affecting properties of HAZ, gas-metal, slag-metal and solid state reactions in welding					
	and their influence on soundness of weld joint, common metal system and their					
	weldability: work hardenable, precipitation hardenable and heat treatable alloys					
2.	Weldability of Plain Carbon Steels: Various grade of plain-C steels, factors affecting	6				
	Weldability, viz., Carbon content, section thickness, Mn/S ratio, phosphorus					
	concentration, microstructure of weld and HAZ, cold cracking and lamellar, tearing					
	gas porosity, mechanism, causes and prevention of defects in plain –C steel welds,					
3.	Weldability of Stainless and Heat Resisting Steels: properties of stainless steels	8				
	affecting weldability, common types of stainless steel austenitic, martensitic, ferritic					
	and PH steel and their weldability, problems in welding of stainless steel and their					
	remedy, weld decay, sigma phase formation, knife line cracking, stress corrosion					
	cracking.					
4.	Weldability of HSLA Steels: Common grades of high strength low alloy (HSLA)	6				
	steels, effect of various alloying elements on weldability, factors affecting weld-metal					
	and HAZ Properties, problems and defects encountered in welding, post weld heat					
	treatment of HSLA steels					

S. No.	Contents	Contact Hours
5.	Weldability of Cast Irons: Common grades of cast irons, carbon equivalent in cast irons, factors affecting weldability of cast irons, approaches for welding of cast irons common problems encountered during the welding of cast and their remedy.	6
6.	Weldability of Aluminium Alloys: Physical metallurgy of heat treatable and work hardenable aluminium alloys, properties of aluminium alloys and weldability, solidification cracking, hydrogen induced porosity, partial melting zone and liquation cracking, HAZ softening, precautions in the welding of age hardenable alloy.	6
7.	Weldability of Copper Alloys: Common copper alloys, properties of copper alloys and weldability, effect of various alloying element of weldability, problem in welding of heat treatable and none-heat treatable copper alloys and their remedy.	6

9. Objective: The course will highlight the different surface degradation phenomena, importance of the surface engineering techniques, their benefits and limitations. Selective characterisation techniques for quality assurance of engineered surfaces will be introduced.

S. No.	Contents	Contact			
		Hours			
1	Introduction: Concept and Importance, classification of surface modification	3			
	techniques, advantages and their limitations.				
2	Surface Degradation: Causes, types and consequences of surface degradation,	10			
	Forms of wear - adhesive, abrasive, surface fatigue, corrosive, fretting and				
	erosive wear, Classical governing laws related to wear, techniques to evaluate				
	the wear damage.				
3	Materials for Surface Engineering: Materials characteristics, their	9			
	importance in surface engineering, wear resistant materials, selection of				
	materials for engineering the surfaces for specific applications, New coating				
	concepts including multi-layer structures, functionally gradient materials				
	(FGMs), intermetallic barrier coatings and thermal barrier coating.				
4	Coating based Surface Modification Techniques: Principles and application of	8			
	weld surfacing: SMAW, SAW, GMAW, Thermal spraying - flame spraying,				
	electric arc spraying, plasma spraying, detonation gun spraying and high				
	velocity oxy fuel spraying Electro deposition and electro less coatings.				

5	Diffusion based Surface Modification Techniques: Ion implantation,	4
	chemical vapour deposition (CVD) and physical vapour deposition (PVD),	
	carburizing, nitriding, plasma nitriding, cyaniding.	
6	Irradiation based and Laser Assisted Surface Engineering (LASE)	4
	Techniques: Laser cladding, alloying, glazing, laser and induction hardening,	
	heat treatment of steel and remelting by laser / TIG. Microwave glazing.	
7	Characterisation and Quality Assurance of Engineered Surfaces:	4
	Importance, Different characterisation techniques - physical, mechanical and	
	functional characterisations, surface finish, microhardness, strength and	
	tribological characterisations.

Practical work

Assignments on various aspects of geometric modeling, fabrication of prototype, programming assignments and project work.

NAME OF DEPTT. /CENTRE: Department of Mechanical and Industrial Engineering

1.	Subject Code: MIN-603	Course Title: Finite Element Method for Thermal Enginee	ering
2.	Contact Hours : L: 3	T: 1 P: 0	
3.	Examination Duration (H	rs.): Theory 3 Practical 0	
4.	Relative Weight: CWS	25 PRS 0 MTE 25 ETE 50 0 E	
5.	Credits: 4	6. Semester: Spring 7. Subject Area: PEC	

- 8. Pre-requisite: **Nil**
- 9. Objective: To introduce the recent developments in field of finite element analysis for a better engineering design.
- 10. Details of Course:

S. No.	Contents	Contact Hours
1	Basic Concepts of Finite Element Methods : Introduction, variational methods, collocation method, subdomain method, Galerkin's method, least squares method.	4
2	Finite Element in 1-D : Basis steps of finite element analysis, linear element, notation, weighted functions, weighted residual integral, boundary condtions, global matrix, Galerkin's formulation, Applications to fin problem, fluid flow problems.	8
3	Finite Element in 2-D : Single variable problems in 2-D, types of elements, triangular and rectangular elements, iso-parametric concept, higher order elements, numerical integration and computer implementation, higher order shape functions, boundary conditions, Galerkin's formulation, applications to conduction and convection heat transfer problems, plane stress and plane strain problems.	10
4	Time dependent field problems : Galerkin's method, consistent and lumped formulations, finite difference solution in time, numerical oscillations, example problem from heat transfer and flow problems, computer implementation	6
5	Flow problems : Governing equations for continuity, momentum and energy conservations, velocity-pressure formulation, velocity-vorticity formulation, finite element implementation for the solution of Navier- Stokes equations, Eulerian velocity correction method, application to two- dimensional problem, pressure boundary condition, computer	8

	implementation	
6	Non-linear problems: Non-linear elasticity, non-linear thermo-physical	
	properties, implementation of Galerkin's method for non-linear heat	6
	conduction equation, application of Newton-Raphson method and other	
	methods for non-linear heat transfer and flow problems.	
	Total	42

9. Objective: To introduce students to the fundamental concepts of fire dynamics a base-level understanding of the principals of fire dynamics, compartment fire and smoke movement.

S. No.	Contents	Contact Hours
1	Introduction: Fuels and combustion processes; physical chemistry of	3
	combustion in fires; summary of the heat transfer equations of	
	conduction, conection and radiation	
2	Premixed Fl ames: Limits of flammability; structure of premixed	6
	flame; heat loss and measurement of burning velocity; variation of	
	burning velocity with composition, temperature, pressure, suppressant	
	and turbulence.	
3	Diffusion F lames and Fire Plumes: Laminar and turbulent jet	7
	flames; flames from natural fire: buoyant plume, fire plume, upward	
	flow; interaction of fire plume with compartment boundaries; effect of	
	wind on fire plume	
4	Steady Burning of Liquids and Solids: Burning of liquids: pool fire,	
	burning of liquid droplets; burning of solids: synthetic polymers,	4
	wood, dusts and powders	
5	Frictionless Compressible Flow: Governing equations, full potential	6
	equation, flow through constant area ducts with heat transfer,	
	Rayleigh lines.	

6	Ignition and Spread of Flames: Ignition of liquids and solids; Flame	5
	spread over liquids and solids;.	
7	Pre-flashover and Post-flashover Compartment Fire: Growth of flash- over: necessary conditions; ventilation requirements; factors affecting time to flashover and fire growth; fully developed fire behavior; temperature in fully developed fire; fire resistance and fire severity.	6
8	Production and Movement of Smoke: Production and measurement of smoke particles; test for smoke production potential; smoke movement; smoke control systems	5
	Total	42

9. Objective: To impart knowledge on concepts of friction and wear of engineering materials.

S. No.	Contents	Contact Hours
1.	Introduction: Concept of a surface and surface topography of	4
	engineering surfaces; Interaction between contacting surfaces,	
	concept of elastic and plastic deformation, Hertz's contact theory;	
	Concept of surface forces – electrostatic forces, capillary forces and	
	van der Waal forces.	
2.	Friction: Concept and laws of friction; Theories of friction, rolling	5
	friction, sliding friction, Coulomb model, junction growth, asperity	
	deformation, stresses in friction; Temperature in friction.	
3.	Friction and Engineering Materials: Friction of metallic materials,	7
	ceramics, polymers and lamellar solids.	
4.	Assessment and Control of Friction: Assessment of co-efficient of	4
	friction, measurement of friction force and contact temperature,	
	assessment of surface forces, tribometer and atomic force	
	microscope (AFM); Lubricants in reducing friction	
5.	Wear: Concept of wear of engineering surfaces; Types of wear;	5
	Sliding wear, dry and lubricated wear of surfaces, chemical wear.	
6.	Wear Mechanisms: Abrasion; Adhesion; Erosion; Fatigue;	7
	Corrosion; Other forms of wear.	
7.	Wear Characteristics of Engineering Materials: Wear of metallic	6

	materials, ceramics, composites and polymers.	
8.	Wear estimation and Control: ASTM standards for estimation of wear of engineering surfaces; Modification of functional surfaces for minimization of wear, selection of materials and techniques.	4

- 8. Pre-requisite: Nil
- 9. Objective: To expose the students to in various numerical methods and modeling tools to model and simulate manufacturing and materials processing operations.

S. No.	Contents	Contact Hours
1.	Introduction to Numerical Methods: Introduction, Linear equations, Non-linear equations, Functional approximation, Numerical differentiation, Numerical integration, Ordinary differential equations, Partial differential equations, Finite difference method, Finite element method, Finite volume method, Orthogonal collocation, Boundary integral method, Optimization	8
2.	Science Base of Mathematical Model Development: Introduction, Fluid flow phenomenon, Heat transfer, Diffusion and mass transfer, Multiphase flow	8
3.	Modeling of C asting & S olidification P rocess: Fundamentals of casting and solidification process, Heat flow in solidification, Solidification of mushy zones, Finite element simulation of solidification problems, Modeling and formulation of casting problems, case studies, Macro-modeling of solidification; Numerical approximation methods, Discretization of governing equations, Solution of discretized equations, Application of macro-modeling of solidification	10

4.	Modeling of Met al Forming Processes: Introduction, Plasciticity	10
	fundamentals: von Mises yield criterion, Tresca yield criterion, Flow	
	rule, Generalised stress & generalised strain increment, Plastic	
	anisotropy, Anisotropic yield criterion, Plastic instability, Process	
	modeling: Uniform energy method, slab method, slip-line field	
	method, upper bound method, Visioplasticity method, Finite element	
	method, Application of finite element method, Eulerian rigid-plastic	
	FEM formulation for plane strain rolling, Governing equations	
5.	Modeling of Welding Processes: Weld pool heat & fluid flow,	6
	Modeling of fluid dynamics & coupled phenomenon in arch weld	
	pools, finite element analysis of welding residual stress &	
	distribution	
	Total	42

- 9. Objective: The main objective of the course is to impart an understanding of the manufacturing science and engineering of non-metals. The course deals with the study of the basic nature of different non-metals and the manufacturing processes.
- 10. Details of Course:

S. No.	Contents	Contact Hours
1.	Introduction: Classification of engineering materials and processing	3
	techniques, structure and properties of non-metals	
2.	Processing of Glass: Glass structure and properties, glass melting	3
	and forming, glass annealing	
3.	Processing of cera mics: Ceramic powder preparation, synthesis of	7
	ceramic powders, fabrication of ceramic products from powders:	
	pressing, casting, vapour phase techniques, sintering, finishing,	
	machining. ceramic coatings	
4.	Processing of Plastics: thermoplastics and thermosets, Processing of	8
	Plastics: Extrusion. Injection moulding. Thermoforming.	
	Compression moulding. Transfer moulding. General behavior of	
	polymer melts, Machining of plastics	
5.	Processing methods of p olymeric matrix composites:	10
	Classification of composite materials, properties of composites hand	
	lay-up, autoclaving, filament winding, pultrusion, compression	
	molding, pre-pegging, sheet molding compounds etc., process	
	capability and application areas of various techniques	
6.	Ceramic matrix composites: mechanical properties of ceramic	6

	matrix composites, different processing techniques for ceramic matrix composites, process capability and applications of various techniques	
7.	Secondary processing of composite materials: Need of secondary operations, different type of secondary operations, machining and drilling of non-metals, machining induced damage, different methods of reducing the damage on account of secondary processing	5

1. Subject Code: HS-001B	Course Title:	Communicatio (Advanced)	n Skills
2. Contact Hours: L: 1	T: 0	Ρ:	2
3. Examination Duration (Hrs.):	Theory 2	Pract	ical 0
4. Relative Weight: CWS 2	5 PRS 00	MTE 25 ETE	50 PRE 0
5. Credits: 2 6. Set	mester: Autumn	/Spring 7.	Subject Area : HSS

8. Pre-requisite: NIL

9. Objective: The course intends to train the learners in using both verbal and non-verbal communication effectively.

S. No.	Contents	Contact
		Hours
1.	Advanced Communication Skills: Scope, Relevance, & Importance	01
2.	Soft Skills: Interpersonal Communication; Verbal & Non-verbal,	03
	Persuasion, Negotiation, Neuro-Linguistic Programming	
3.	Communication and Media (Social and Popular), The Social and	04
	Political Context of Communication, Recent Developments and	
	Current Debates in Media	
4.	Cross-cultural and Global Issues in Communication: Race, Ethnicity,	03
	Gender & Diaspora	
5	Photoria and Public Communication Audience Autoronase Emotionality	02
э.	Kilcione and Fublic Communication, Audience Awareness, Emotionality	03
	Total	14

List of Experiments:

- 1. Discussion on the Process of Communication in Personal and Professional Life
- 2. Group Discussion, Case Studies and Role-Play
- **3.** Assignments on E-mail Etiquette, Social Networking, Blog Writing, Discussions on Current Issues
- 4. Non-Verbal Communication in Cross-Cultural Situations, Case Studies, Group Discussions and Readings on Topics Related to Race, Ethnicity, Gender and Diaspora
- **5.** Individual Presentations (Audience Awareness, Delivery and Content of Presentation)

NAME OF DEPTT./CENTRE: Mechanical & Industrial Engineering Department

- 8. Pre-requisite: Nil
- 9. Objective: To provide basic concepts of kinematic analysis of machines and machine members.

S. No.	Contents	Contact Hours
1.	Introduction: Objective of kinematic analysis of mechanism, classification of links, pairs, Basic terminology and kinematic symbols, kinematic chains, plane motion; constraints and degrees of freedom, mechanism and machines, inversion of mechanisms along with their practical applications.	7
2.	Motion Analysis of Mechanisms: Kinematic quantities and their relationships, absolute ad relative motions, and their vector representation, instantaneous centers of motion, Kennedy Arnold's theorem; relative velocity method, method of instantaneous centers, resolution and orthogonal velocity methods; Acceleration analysis, Significance of Coriolis component of acceleration in mechanisms and its determination, mathematical analysis of slider crank mechanism, special graphical methods	10
3.	Motion synthesis: Introduction to synthesis of mechanisms, Graphical methods of Synthesis, Chebyshev spacing, two position synthesis, application to four bar mechanism , analytical synthesis using complex algebra , Freudensteins method.	4

4.	Applied Linkages : Radial engines and master crank, straight line motion and indicator mechanisms, steering mechanism, quick return mechanism, intermittent motion generating mechanisms, Geneva mechanism, analog computing mechanisms, various types of ingenious mechanism and their functioning.	5
5.	Cams; Classification of different types of cams, types of motion curves and their analytical expressions, graphical construction of cam profiles for different types of follower, pressure angle and cams with specified contours.	5
6.	Gears : Classification and Basic terminology, Fundamental law of gearing, geometric and kinematic considerations for various tooth profiles, the cycloidal and involute profiles , standards in tooth forms, spur gears and other types of gears; Gear trains, Simple, compound and epicyclic gear trains and their applications.	7
7.	Flexible connectors : Advantages and disadvantages of belt drives, Kinematic analysis of flat belt and V- Belt drives.	4
	Total	42

NAME OF DEPTT./CENTRE: Mechanical & Industrial Engineering Department

- 8. Pre-requisite: MI-201
- 9. Objective: To introduce the students to various concepts related to dynamic analysis of machines.
- 10. Details of Course:

S. No.	Contents	Contact Hours
1.	Force Analysis of Mechanisms: Review of basic principles of statics,	10
	Concept of free body and its equilibrium, Transmission of forces in	
	machine elements, static force analysis, friction effects, forces on gear	
	teeth; D'Alembert's principle, dynamic force analysis of mechanisms,	
	force analysis of cam and follower mechanism, equivalent dynamical	
	systems, dynamic analysis of reciprocating engines, practical	
	examples from actual machines.	
2.	Flywheels and Governors: Turning moment diagram, Fluctuation of	6
	energy and speed, coefficient of fluctuation of speed, use of crank	
	effort diagram, calculation of flywheel size; Advantages of governors,	
	Analysis of different types of governors, effect of sleeve friction,	
	characteristic of governors, controlling forces curves, sensitivity,	
	hunting phenomena in governors, stability, governor effort and power.	
3.	Balancing: Balancing of rotating masses in single plane and in	4
	different parallel planes, balancing of slider crank mechanisms,	
	balancing of in-line, V- and locomotive engines, principles of	
	balancing machine.	

4.	Friction Devices: Advantages and disadvantages of belt drives system, belt drive system, friction in pivots and collars, power screws, plate and cone clutches, band and block brakes.	6
5.	Gyroscope: Motion of rigid body in 3- dimensions, Angular momentum, Gyroscopic action, equation for regular precession and gyroscopic torque, applications of gyroscope	2
6.	Mechanical Vibration: Basic terminology related to vibrations; Conservative systems; Free vibrations of systems without and with damping; Equilibrium and energy methods for determining natural frequency of vibratory system; Rayleigh's method, Free vibrations of system with viscous damping, over damped, critically and under damped systems, logarithmic decrement; Forced vibrations of systems with viscous damping, equivalent viscous damping; Impressed forces due to unbalanced masses and excitation of supports, vibration isolation, transmissibility, whirling of shaft; Introduction to multi degree of freedom system vibrations: Discrete and continuous systems.	14

NAME OF DEPTT./CENTRE: Mechanical & Industrial Engineering Department

- 8. Pre-requisite: Nil
- 9. Objective: To introduce the basic principles of control theory and its applications along with the methods of stability analysis and synthesis of industrial control systems.
- 10. Details of Course:

S. No.	Particulars	Contact Hours
1.	Introduction : Introduction to automatic control systems, open loop and closed loop systems, servomechanism, design principles of	3
	control systems.	
2.	Mathematical Model of Physical System: Transfer functions, linearization of non-linear functions, linearization of operating curve, block diagrams and block diagram algebra, modeling in frequency and time domain, translation and rotational mechanical components, electrical components, series and parallel combinations, compactors for rotational and linear motions, integrating devices, hydraulic servomotor, temperature and speed control systems.	9
3.	Transient Response Analysis: First and second order systems response to step, pulse, ramp and sinusoidal inputs, higher order systems, Routh's Criteria.	2
4.	Error Analysis and Introduction to system Optimization : Steady state errors, Static error coefficient, dynamic error coefficients, error criteria, introduction to system optimization.	2
5.	Control Action: Proportional control, integral control, derivative control, combination of control actions and their effect on system	8

	performance, two position control, industrial control systems using various control actions.	
6.	Control System Analysis: Stability of control systems, root locus techniques, root locus plots of simple transfer functions, stability analysis and transient response from root locus; frequency response analysis, logarithmic plots, stability and relative stability analysis on Bode plots, experimental determination of transfer function.	10
7.	Design and Compensation techniques: Introduction of preliminary design consideration, lead and lag compensation, compensation, laglead compensation, summary of control system compensation methods, practical examples.	4
8.	Control System Analysis Using State Variable Method : State variable representation, conversion of state variable model to transfer function, conversion of transfer function to canonical state of variable models, solution to state equations, concept of controllability and observability, signal flow graph, equivalence between transfer function and state variable representations.	4

NAME OF DEPTT./CENTRE: Mechanical & Industrial Engineering Department

- o. The-requisite.
- 9. Objective: To develop the understanding of tribological phenomena and fluid-film lubrication.
- 10. Details of Course:

S. No.	Contents	Contact Hours
1.	Introduction: Brief history of tribology, Tribological Considerations in the design of machine elements, role of wear, friction and lubrication, geometrical properties of surfaces, method of studying surface; Contact of smooth surfaces, contact of rough surfaces; Role of friction, laws of static friction, cause of friction; Bowen & Tabor's theory of friction, laws of rolling friction, friction of metal and nonmetals, friction measurement; Wear definition, types of wear, wear mechanism, a brief introduction of wear test equipments, wear in plastics.	10
2.	Industrial Lubricants and their Additives : Functions of lubricants; Types of lubricants and their industrial uses; Solid lubricants and their functions, liquid mineral lubricants, synthetic liquid lubricants, greases, properties of liquid and grease lubricants; Viscosity, Newtonian and non-Newtonian lubricants, Electrorheological, Magnetorheological and micropolar lubricants, temperature and pressure dependence of viscosity, other properties of lubricants; Lubricant additives, general properties and selection for machines and	10

	processes; Oil reclamation and preventive maintenance for lubricants.	
3.	Fluid-Film Lubrication: Equations of continuity and motion; Generalized Reynold equation with incompressible and compressible lubricants; lubrication regimes, Stribeck curve; Hydrodynamic lubrication; Tower's experiment, finite journal bearings, solution of finite bearing using Galerkin method, finite difference and FEM, significance of flow restrictors in compensated bearings.	12
4.	Bearing Design and selection of Bearings: Comparative performance of various modes of lubrication, and bearing selection; Design of slider bearings and hydrostatic journal bearing, fixed type hydrodynamic and hydrostatic journal bearings, materials for sliding bearings; Bearing types, selection of rolling elements bearing, bearing life, dynamic load rating, bearing selection.	6
5.	Some case studies related to tribological failures in machines	4

9. Objective: The course introduces design aspects for pressure vessels and pipings.

S. No.	Contents	Contact Hours
1.	Introduction: Industrial pressure vessels and piping systems. Type of	4
	failures of pressure vessels and piping systems. Safety of an Industrial	
	plant.	
2.	Design Aspects of Pressure Vessel and Piping: General theory of	12
	membrane stresses, stresses in cylinders and spheres subjected to	
	internal and external pressure.	
	Dilation of pressure vessels, auto-frettage and shrink fit stresses,	
	mono-block and wire-wound cylinders, thermal stresses and their	
	significance. Design of bottoms and roofs and cylindrical vessels,	
	discontinuity stresses in vessels, deformation and stresses in flanges.	
3.	Fracture Mechanics Concepts and Design Application.	4
4.	Construction Features of Pressure Vessels: Construction features	6
	of pressure vessels, localized stresses and their significance, welded	
	joints, bolted joints, theory of reinforced openings.	
5.	Relevant National and International Design Codes and Their	2
	Limitations.	

6.	Importance of Stress and Flexibility Analysis of Piping System: Analysis of stresses due to static and dynamic loads, thermal stresses; Flexibility analysis for single and multi-plane configuration, Expansion joints and anchorages.	8
7.	Design Features of Piping System: Pipe fittings, elbows and flange design, wall thickness determination, branched connections. Piping network analysis.	4
8.	Selection of Pipe Materials and Economical Considerations in Piping Design.	2
	Total	42

NAME OF DEPTT./CENTRE: Mechanical & Industrial Engineering Department

8. Pre-requisite: **CEN-102**

9. Objective: The course deals with the various aspects concerning the piping technology.

S. No.	Contents	Contact Hours
1.	Design/Analysis of Piping System: Industrial, sub-sea & underground piping systems. Design and stress analysis of piping system. Pipe fittings, elbows and flange design, stresses in elbows and flanges. Failure theories, National and International codes. Branched connections. Piping network analysis. Design calculation of wall thickness and working pressure. Use of FEM and software tools. Pipeline sizing, Design criterion; least annual cost criterion, velocity criterion, Pressure drop criterion,	18
2.	Vibration Problem in Piping System; Experimental Tests on Piping System/Components: Vibration analysis of piping system, Determination of natural frequency, damping and mode shape. Design of experiments for piping system. Estimation of leakage of piping connections/joints.	8
3.	Pipeline Machinery, Operation & Control: Description of various components, methods for control strategies. Field metering and	6

	Total	42
	Water injection pumps.	
	specifications, sources of injected water, filters, de-oxygenation,	
	injection, equipments, material for constructions, design	
	definition, water injections, water sources, treatment for sea water	
6.	Well Head Installation & Water Injection: Introduction,	4
	Recommended piping materials.	
	pipelines, Internal inspection and Corrosion monitoring.	
	corrosion, Anti-corrosive protective coatings, Cathodic protection of	
	types of corrosion in pipelines. Techniques for the prevention of	•
5.	Prevention of Corrosion in Pipelines: Corrosion process. Various	4
	nipelines. Maintenance techniques. Cleaning of nipe internal surface	
	NDT techniques for inspection and tools for quality control of	
	Shrouded metal are welding. Dry under water welding. Visual and	
	welding in Offshore constructions GMA welding SMA welding	
	techniques/processes, welding procedures and equipments, Various	
4.	Joining Techniques and Quality Control of Pipelines: Welding	4
	maintenance equipments. Structural supports of piping system.	
	operation. Linear and nonlinear pipelines. Pipeline installation and	
	mass flow measuring techniques, Pigging, examples of pigging	
	regulating facilities, pressure surges, Anti-surge control, Coriolis

- 8. Pre-requisite: Nil
- 9. Objective: To introduce functional details and requirements of various components in automobiles.
- 10. Details of Course:

S. No.	Contents	Contact Hours
1.	Power Unit: Engine classification, engine performance	8
	characteristics, description of power unit, fuel supply system, hybrid vehicles, engine lubrication.	
2.	Transmission: Transmission requirement, standard transmission system, fluid transmission system, automatic transmission, performance requirements and gear ratios, tractive resistance.	7
3.	Steering: Different types of steering systems, performance requirements, power steering.	4
4.	Vehicle Dynamics: Stability analysis of vehicle, stability on curved path.	3
5.	Braking Systems: General braking requirements, weight transfer during braking, mechanical brakes, hydraulic brakes, vacuum brakes, power brakes.	4
6.	Chassis and Suspension: Loads on the frame, general consideration of strength and stiffness, engine mounting, various suspension systems including active suspension, shock absorbers.	4
7.	Pneumatic Tyres: Tyre-pavement interaction forces and moments,	2

	SAE terminology, tyre wear.	
8.	Electrical System: Ignition system, conventional and electronic,	4
	lighting, auxiliary electrical equipment, wiring diagrams.	
9.	Maintenance: Preventive maintenance, trouble shooting, tuning and	3
	adjustment of power unit.	
10.	Air Pollution: Pollution due to vehicle emission, exhaust emission	3
	control systems, effect of design and operating conditions.

9. Objective: This course will introduce to the students, the basic concepts, techniques and applications of engineering optimization in a comprehensive manner.

S. No.	Contents	Contact
		Hours
1.	Introduction to Design Optimization: The design process; basic	2
	terminology and notations.	
2.	Optimum Design Problem Formulation: The problem formulation	3
	process; and illustration with examples.	
3.	Graphical Optimization: Graphical solution process; problems with -	3
	bounded (single or multiple) and unbounded solutions.	
4.	Optimum Design Concepts: Local and global optima; necessary and	6
	sufficient optimality conditions for unconstrained and constrained	
	multivariate functions.	
5.	Linear Programming Methods for Optimum Design: Basic	4
	concepts; simplex method; two-phase simplex method; post-optimality	
	analysis.	
6.	Numerical methods for Unconstrained and Constrained Optimum	6
	Design: Gradient-based and direct search methods; Sequential linear	
	and quadratic programming.	
7.	Multi-objective Optimization: Fundamental shift from single-objective	4
	optimization; Pareto-set and Pareto-optimal Front.	

8.	Evolutionary Techniques for Optimization: Genetic algorithms;	6
	Differential Evolution Algorithms; Ant colony Optimization; and Particle	
	Swarm Optimization.	
9.	Advanced topics on Optimum Design: Meta models for design	4
	optimization; design of experiments; discrete design with orthogonal	
	arrays; robust design approach; reliability-based design optimization.	
10.	Practical applications of optimization: Illustration on engineering	4
	problems with single and multiple objectives.

NAME OF DEPTT./CENTRE: Mechanical & Industrial Engineering Department

- 8. Pre-requisite: CEN-102, MIN- 205
- 9. Objective: This course expounds on the basic principles of the finite element method and its application to solve a few representative mechanical engineering problems related to solid mechanics, heat-transfer, and fluid mechanics.
- 10. Details of Course:

S. No.	Contents	Contact Hours
1.	Introduction: Underlying principles of the finite element analysis;	02
	application examples and versatility; basic steps in FEA.	
2.	Mathematical Preliminaries: Principle of virtual work; Ritz method;	07
	weighted residual; collocation and Galerkin methods; classification of	
	partial differential equations and the corresponding mechanical	
	engineering applications; Poisson's, Laplace's, diffusion and wave	
	equation; review of governing equations in solid and fluid mechanics.	
3.	One Dimensional Problems: discretization, concept of shape	08
	functions, natural coordinates; element equations; assembly; boundary	
	conditions; solution of assembled matrix equations; applications to	
	solid mechanics, heat and fluid mechanics problems.	
4.	Trusses: Plane truss, local and global coordinate systems; stress	04
	calculations; temperature effect on truss members; solution of	
	practical problems.	
5.	Beams: Euler-Bernoulli beam element	04

6.	Two Dimensional Problems: Plane stress and plane strain	08
	formulation; triangular and rectangular elements; isoperimetric	
	formulation; axisymmetric problems; computer implementation;	
	steady-state heat conduction	
7.	Finite Element Analysis of Time-dependent Problems:	05
	Discretization of equation of motion; mass and stiffness matrices;	
	eigenvalue problem; mode-shapes and natural frequencies; time-	
	integration methods.	
8.	Computer Implementation of Finite Element Analyses:	04
	Introduction to commercial packages and their capabilities;	
	demonstration of the modeling and solution process for representative	
	cases.

8. Pre-requisite: CEN-102			

9. Objective: This course introduces the science of MicroElectroMechanical Systems, actuation and sensing mechanisms at the microscale, and conveys ideas related to the mechanical analysis of MEMS and basics of the microfabrication techniques.

S. No.	Contents	Contact Hours
1.	Introduction: Introduction to MEMS; historical perspective;	02
	application examples; course motivation.	
2.	Preliminaries of Continuum Mechanics: Continuum hypothesis;	07
	governing equations of elasticity; thermo-elasticity; review of fluid	
	dynamics principles; Navier-Stokes equation; Euler equation;	
	fundamentals of electromagnetism; Maxwell's equations;	
	electrostatics; magnetostatics; dimensional analysis and scaling laws	
	of forces at the microscale; different actuation and sensing techniques	
	used at the microscale.	
3.	MEMS Sensors and Actuators: Pressure sensors; accelerometers;	10
	gyroscopes; RF MEMS devices; MEMS resonators; switches; digital	
	micro mirror devices: principle of operation and mathematical	
	modeling.	
4.	Mechanical Analysis of Electrostatically Actuated MEMS	15
	Devices: Static analysis; spring constant for beams; electrostatic	
	actuation; parallel-plates model; torsional plate actuator; comb drive	
	actuator; shape of a deformed beam under electrostatic actuation;	
	moderately large deflection analysis of fixed-fixed beams; dynamic	

	analysis; mechanisms of energy dissipation; air damping	
	fundamentals; squeeze film damping; Reynold's equation; dynamics	
	response of beam-type actuators under electrostatic loading.	
5.	Introduction to Microfabrication Techniques: Basic process tools;	08
	oxidation; sputter deposition; chemical-vapor deposition; lithography;	
	etching; advanced process tools: anodic bonding; silicon direct	
	bonding; SU-8 photosensitive epoxy; Nonlithographic fabrication	
	processes: laser machining, electrodischarge machining.

9. Objective: This course introduces the elements of energy methods and variational calculus together with their application to solve mechanical engineering problems.

S. No.	Contents	Contact Hours
1.	Motivation and Mathematical Preliminaries: Role of energy	08
	methods; historical perspective; review of vectors and vector calculus;	
	basic equations in solid mechanics; index notation; conservation of	
	linear and angular momentum; stress tensor; kinematics of	
	deformation; strain tensor; constitutive laws.	
2.	Introduction to the Calculus of Variations: The variational	07
	operator; concept of a functional; extremum principles; functionals of	
	one independent variable; functionals of two independent variables.	
3.	Basic Notions of Energy Methods: Virtual work; total potential	06
	energy and complementary potential energy; stability criteria;	
	Castigliano's Theorem I; Castigliano's Theorem II; Betti and Maxwell	
	reciprocity theorems.	
4.	Energy Methods for the Static Analysis of Deformable Solids:	11
	Analysis of deformable members such as longitudinal bars, Euler-	
	Bernoulli beams, membranes and plates under static loading	
	conditions using variational principles; separation of natural and	

	essential boundary conditions; introduction to Ritz, weighted residual, and Galerkin methods; Introduction to the finite element method.	
5.	Energy Methods in Structural Dynamics: Hamiltonian and Lagrangian dynamics; principle of least action; Euler-Lagrange equation; conservative and non-conservative systems; dynamics of non-deformable bodies; stability criterion; dynamics of deformable bodies: longitudinal vibration of rod, transverse vibration of strings and Euler-Bernoulli beams.	10

- 9. Objective: To introduce the basic concept of theory of vibrations and noise control in mechanical systems.
- 10. Details of Course:

S. No.	Contents	Contact Hours
1.	Introduction: Simple Harmonic motion, Fourier analysis,	2
	Conservative systems.	
2.	Systems Having Single Degree of Freedom: Free vibrations of	12
	systems without damping, equilibrium and energy methods for	
	determining natural frequency; Rayleigh's method; Equivalent	
	systems, systems with compound springs, shaft of different	
	diameters; Free vibrations of system with viscous damping, over	
	damped, critically and under damped systems, logarithmic	
	decrement; Coulomb and structural damping; Forced vibrations of	
	systems with viscous damping, equivalent viscous damping, power	
	consumption in vibrating system, impressed forces due to	
	unbalanced masses and excitation of supports, vibration isolation,	
	transmissibility, commercial isolators; Vibration isolation using ER	
	fluids.	
3.	Vibration Measuring Instruments: Principle of frequency,	2
	displacement, velocity and acceleration measuring instruments,	
	distortion effect.	

4.	Systems with two Degrees of Freedom: Free undamped vibrations,	4
	static and dynamic coupling, principal modes of vibration,	
	undamped dynamic vibration absorber, centrifugal pendulum	
	absorber.	
5.	Multi-Degree of Freedom Systems: Influence coefficients, eigen	4
	values and eigen vectors, matrix iteration; Dunkerley and Rayleigh's	
	method.	
6.	Whirling of Shafts: Whirling of light flexible vertical/horizontal	2
	shaft with an unbalanced disc at the centre of its length with and	
	without damping.	
7.	Continuous Systems: Vibration of strings, free longitudinal	4
	vibrations of prismatic bars, torsional vibrations of circular shafts,	
	lateral vibrations of uniform beams.	
8.	Noise Control in Mechanical System: Review of Fundamentals:	12
	Noise and vibration measurement units, levels, decibels, spectra.	
	Objective/Subjective noise measurement-scales; Addition and	
	subtraction of decibles; Frequency analysis bandwidths; Relationships	
	for the measurement of free field sound propagation; The directional	
	characteristics of sound sources; Sound power models.	
	Industrial Noise and Vibration Control: Basic sources of industrial	
	noise and vibration, basic industrial noise and vibration control	
	methods; The economic factor; Sound transmission from one room to	
	another acoustic enclosures, acoustic barriers, sound absorbing	
	materials; Vibration control procedures; Fault detection from noise	
	and vibration signals.

S. No.	Contents	Contact
		Hours
1.	General:	14
	Introduction to design procedure; design requirements; review of force analysis concepts; materials selection for design.	
	Types of failures; theories of failures and their applications; factor of safety concepts,	
	statistical considerations in design; Motor selection and matching of machinery.	
	Causes of stress concentration; stress concentration factors; mitigation of stress	
	concentration.	
2.	Dynamic loading:	05
	Cyclic loading, endurance limit, effects of type of loading, size and surface finish; notch	
	sensitivity; reliability considerations; Goodman and Soderberg diagrams; cumulative	
	fatigue damage.	
3.	Design of Machine Elements:	31
	Design of keys, threaded fasteners and power screws, belt and chain drives;; coil springs. Design of welded joints	
	Design of spur, helical and worm gears; design of shafts; analysis of forces and bearing	
	reactions; selection of rolling elements bearings. Design of clutches & brakes.	
4.	Principles of Machinery Construction:	06
	Support and retainment of rotating assemblies, speed and motion changing devices,	
	casting and weldment design, machine frame and housing design,	
	Self-Study	
	Design of keys and couplings; riveted and welded joints; design of bevel gears;	

corrosion and wear considerations in design

S. No.	Name of Books / Authors	Year of publication
1.	Mechanical Engg. Design, Shigley and Mitchke, McGraw Hill	2003
2.	Machine Design, Robert L. Norton, Pearson Education Asia	2001
3.	Fundamentals of Machine component design, Juvinall and Marshek, John Wiley	2002
4.	Design Data Hand book, Mahadevan and Balaveera Reddy, CBS Publishers	2003
5.	Machine Design. Paul H. Black & O. E. Adams. McGraw Hill	1981

- 8. Pre-requisite: MIN-108
- 9. Objective: This course aims at making the students well versed with the drawing practices for common machine elements, assembly drawings and blue-print reading.
- 10. Details of Course:

S. No.	Contents	Contact Hours
1.	Detachable Fasteners: Screw threads, approximate and	4
	conventional representations; Specifications; Threaded fasteners;	
	Types, forms, standard, and specifications; Drawing of temporary	
	connections; Foundation bolts; Locking Devices; Classification,	
	principles of operation, standard types and their proportions. Shaft	
	Couplings; Common types, standard proportions for some couplings.	
2.	Permanent Fastenings: Rivets; Standard forms and proportions,	4
	Riveted Joints, Common types of joints, terminology, proportions	
	and representation; Welds; Types of welds and welded joints, edge	
	preparation, specifications, and representation of welds on drawings.	
3.	Assembly Drawings: Review of sheet preparation, boundary lines,	6
	zones, title block, revision panel, Parts List; Numbering of	
	components and associated detail drawings; Assembly drawings of	
	various machine sub-assemblies and assemblies from detail	
	drawings, sketched and actual machine components.	

4.	Components Drawing: Limits, Fits, and Tolerances of Size and Form; Types and Grade, Use of Tolerance tables and specification of tolerances, Form and Cumulative Tolerances; Tolerance Dimensioning; General Tolerances; Surface quality symbols, terminology and representation on drawings, correlation of tolerances and surface quality with manufacturing techniques.	6
5	Introduction to AUTOCAD, use of AUTOCAD for assembly and component drawings	4
6	Introduction to Solid modeling software, use of solid modeling software for assembly and component drawings, generation of different views from solid models.	4

NAME OF DEPTT./CENTRE: Mechanical & Industrial Engineering Department

1. Subject Code: MIN-206 Course Title: Mechanics of Materials

- 8. Pre-requisite: **CEN-102**
- 9. Objective: To introduce the methods and tools of mechanics of material for the analysis for various types of engineering problems.
- 10. Details of Course:

S. No.	Contents	Contact Hours
1.	Three Dimensional State of Stress and Strain: Stress and strain	6
	tensor, stress and strain transformations, principal stress and strain,	
	Octahedral planes and stresses.	
2.	Elastic Strain Energy and Energy Methods: Elastic strain energy	13
	due to normal and shear stress, strain energy of a three dimensional	
	principal stress system, dilatational and distortional strain energy,	
	strain energy due to axial, bending and torsional loads; Strain energy	
	and complimentary energy theorems, Castigliano's theorems,	
	theorem of virtual work, theorem of least work, reciprocal theorems,	
	application of energy methods for determining slope and deflection	
	in beams and twists in shafts, unit load method.	
3.	Theories of Elastic Failure: Modes of failure, the necessity and	3
	significance of a failure theory, statement of various theories of	
	failure and their application, graphical representation, comparison	
	and limitations of various failure theories, safety factors.	

4.	Curved Beams: Beams of large initial curvature, location of neutral axis, distribution of stresses across sections having rectangular, circular and trapezoidal shapes.	4
5.	Statically Indeterminate Beams: Conditions of statical indeterminacy, degree of indeterminacy, analysis of built-in beams using integration, superposition and area-moment methods, application of energy methods.	6
6.	Unsymmetrical Bending: Symmetrical and nonsymmetrical beam cross-sections and their properties, product and second moment of area, principal second moments of area, Mohr's circle of second moments of area, bending of symmetrical beam with skew load, bending of beams having unsymmetrical cross-section, location of neutral axis, shear center and its location determination for thin-walled open-sections.	5
7.	Axi-symmetrical Problems: Stresses and displacements in thick cylindrical shells subjected to internal and external pressure, press fits and laminated construction, thick spherical shells. Stresses in rotating cylinders and thin rotating disc, disc having uniform strength in rotation.	5

9. Objective: To provide essential knowledge of basic tools of Differential Calculus, Integral Calculus, Vector Calculus and Matrix Algebra for degree students.

10. Details	of Course:
-------------	------------

S. No.	Contents	Contact
		Hours
1.	Matrix Algebra: Elementary operations and their use in getting the Rank, Inverse	8
	of a matrix and solution of linear simultaneous equations. Orthogonal, Symmetric,	
	Skew-symmetric, Hermitian, Skew-Hermitian, Normal & Unitary matrices and	
	their elementary properties. Eigen-values and Eigenvectors of a matrix, Cayley-	
	Hamilton theorem, Diagonalization of a matrix.	
2.	Differential Calculus: Limit, Continuity and differentiability of functions of two	12
	variables, Euler's theorem for homogeneous equations, Tangent plane and normal.	
	Change of variables, chain rule, Jacobians, Taylor's Theorem for two variables,	
	Error approximations. Extrema of functions of two or more variables,	
	Lagrange's method of undetermined multipliers	
3.	Integral Calculus:	12
	Review of curve tracing and quadric surfaces, Double and Triple integrals,	
	Change of order of integration. Change of variables. Gamma and Beta functions.	
	Dirichlet's integral. Applications of Multiple integrals such as surface area,	
	volumes, centre of gravity and moment of inertia	
4.	Vector Calculus: Differentiation of vectors, gradient, divergence, curl and their	10
	physical meaning. Identities involving gradient, divergence and curl. Line and	
	surface integrals. Green's, Gauss and Stroke's theorem and their applications.	
	Total	42

1.	Subject Code: PHN-00)1	Course 7	Fitle: Me	echanics	
2.	Contact Hours: L: 3		T: 0	P	2:2	
3.	Examination Duration	(Hrs.): Theo	ory: 3	Practi	cal: 0	
4.	Relative Weightage:	CWS: 15	PRS: 25	MTE: 20	ETE: 40	PRE: 0
5.	Credits: 4	6. Semester:	Autumn	7.	Subject Area:	BSC

8. Pre-requisite: None

9. Objective: To familiarize students with the basic principles of mechanics

10. Details of Course:

S.No.	Contents	Contact Hours
1	STATICS OF PARTICLES.	8
	Vectorial representation of forces and moments- Vector Operation-Concepts of	
	Particles and Rigid bodies – Composition of concurrent forces in plane free body	
	Diagram – Equilibrium of Rigid bodies in Two and three dimensions-Moment of a	
	force about a point and about an axis-Couple moment-Reduction of a force system to	
	a force and a couple	
2	PROPERTIES OF SURFACES, MOMENTS AND PRODUCTS OF INERTIA	6
	Definition Moment of Inertia for areas-Parallel axis theorem –Perpendicular axis	
	theorem-Moment of inertia for composite area-product of inertia form an area-	
	mass moment of inertia	
4	FRICTION	4
	Laws of coulomb friction- Coefficient of Friction-Dry Friction-sliding	
	Friction-Ladder friction-Belt friction – Rolling Resistance.	
5	KINEMATICS OF PARTICLES	8
	Principle of virtual work for a particle and rigid body-condition for	
	equilibrium for a conservative system, stability-particle dynamics in	
	rectangular coordinate, cylindrical coordinate and in terms of path variables-	
	General motion of system of particles-	
6	WORK ENERGY METHODS, IMPULSE AND MOMENTUM	8
	Work Energy Method-Conservation of Energy-Impulse and Momentum	
	Relation-Impulsive Force-Impact force-Conservation of momentum – Moment	
	of Momentum Equation.	
7	RIGID BODY MOTION;	8
	Translation and rotation of rigid bodies- Derivative of a vector fixed in moving	
	reference-General relationship between time derivative of a vector for different	
	references-Moment of momentum equation-kinetic energy of rigid body-work	
	and energy relations-Euler's equation of motion-Three dimensional motion	
	about a fixed point	
	TOTAL	42

List of experiments:

- 1. Study of magnetic field of a pair of coils in Helmholtz arrangement
- 2. Determination of e/m
- 3. Determination of first excitation potential of a gas by Frank-Hertz experiment
- 4. Determination of Stefan's constant
- 5. Determination of Planck's constant by radiation
- 6. To study and verify Malus' law
- 7. Study of Polarization of light using quarter wave plate
- 8. Determination of Brewster's angle at glass-air interface
- 9. Determination of with of a slit by single-slit diffraction pattern
- 10. Four probe method of finding resistivity of semiconductor
- 11. Quinck's Method for determining mass susceptibility
- 12. Wavelength of Na light by Newton's ring method
